falsehood, this is a very sufficient one. If a man is known to be a person unworthy of confidence when he speaks, he has not the benefit of being credited even when he speaks the truth; he voluntarily deprives himself of the advantages of social life; his assertions secure to him no credit; his promises are contemned; he makes himself to be alone in the very bosom of society, for every one shuns him. In the administration of justice in courts, a person is not regarded as a witness, whose common reputation is that he is not believed when he speaks. The objection to him is not that he might not tell the truth in the matter which is on trial, but that such a person ought not to be received as a witness, because he cannot be credited in any thing that he says. When such a person has been called and examined as a witness, it is usual to examine other witnesses to prove his character; and if it be proved that he is unworthy of credit, what he has sworn to is disregarded, though he may have declared the truth. This is the common fate of all such unfortunate persons in society, as well as in courts. Independently of the criminality, lying is very poor policy. If the object be to obtain a supposed good, it rarely is obtained by such means; and if it be, the price so paid must always be greater than the good is worth. If the object be to conceal a wrong done, it is rarely successful; and if not, it leaves the offender without excuse for his error, and adds another wrong. If the object be to charge an innocent person with a wrongful act, or to deprive one of his good name, or of some lawful possession, or subject him to some evil which he ought not to endure, the offence is of that cast which the law of the land holds to be *malicious*, and it deals with such offence accordingly. In short, it is very difficult to violate any law of natural justice or divine prohibition without encountering an adequate punishment; and it may be assumed that the punishment which follows lying is as certain and just as in any instance of criminality. If every tenant of every prison, and if every person who is in the custody of a goading conscience, were asked this question, *What was your first step from innocence and purity?* he would probably answer, *Telling a lie!*

SINCERITY AND INSINCERITY.

These are other names for truth and falsehood. They are not commonly applied to the most serious concerns of human life, but to what are called the "imperfect obligations." Such obligations, it is well known, are not enforced by the law of the land, but are binding as duties arising as well from natural law (reasonably expounded) as from divine law. Sincerity is a duty to one's self, because it is demanded by self-respect. As every one has an individual separate physical being, so every one has a *separate circle* within which he exists, and into which no one has a right to intrude. His thoughts, motives, opinions, and policy, are his own. What he will or will not do (so that no wrong be done to others, and no act of duty be withheld from them) is for him to decide upon. Within this circle, he makes up his judgments on all persons and things. In his outward deportment, he must frequently act in a manner not consistent with these judgments. As an example: one has made up, from repeated observations of a certain individual, a very clear but very unfavourable judgment of his qualities; but there is no occasion to disclose what the judgment is. The observer is obliged, or finds it convenient, to meet this individual, and to deal with him, and perhaps to interchange courtesies with him. It is undoubtedly proper to manifest the respect, in such case, which the decencies of life require, and to show the common proofs of good will. There is no insincerity in this. Though no one can possibly avoid forming judgments of others, nor avoid liking or disliking them, even including very near friends and relatives, yet there may be a positive violation of duty in publishing these judgments or in disclosing these feelings. The Divine law, "judge not that ye be not judged," does not, it is believed, interdict these judgments, because they cannot but be made; but it forbids the wanton, unnecessary, and

publication or manifestation of them. Thes

CIVILITY.

The well-being of society would be greatly p
if the nature and use of this Christian virtue w
generally known. We take this to be, in per
tercourse, the observance of the command, Do
as you would that others should do to you. T
rapid glance at any community shows this—th
of its members are brought into contact, in m
business, necessarily; others meet, incidenta
have no particular connexion; others meet f
purposes, in various forms; and that there i
proportion who know of each other very little
the fact that they are of the same country, and
not even that. There must be a *best rule* in
ment for all these classes; and no one will d
if this rule were defined, and faithfully appli

not include under the term *civility* the great
justice, acts of munificence, important perso
vices. These arise out of some special relatio
an individual bears to one or more other ind
It seems to be limited to the manner in which
mon or accidental intercourse of the member
ciety in general should be carried on. This ma
be better understood by some examples. The
comes into the presence of another as a beggar,

›urer, mechanic, trader, merchant, farmer, lawyer, ›ician, clergyman, or public officer, or if it be a ›ale, or child of either sex, there may be very various ›des of receiving these different persons—yet, cer›ly, by every one of the laws which we are endea›ring to illustrate, these several persons are entitled ›ivility. Even the beggar—perhaps one should rather ›, the beggar in particular—if not deformed by volun›y transgression, should be received with civility; that ›gentleness, kindness, decorum, are to be observed ›tively to each one. Why? because no man can ›rd to be deemed insensible to the cause of reason› humanity; nor a stranger to the decencies of life; ' ignorant of what is due from him, nor to him, in ' of his proper relations.

›here is one other consideration which operates on ›men who have had much experience in the world. › and things change, and take new and unexpected ›tions. Persons who have been long, and even inti››ly connected, suddenly or gradually sever; persons have known little of each other, and that little ›teresting or unfavourable, are brought in contact one unexpected turn of affairs. Sometimes one › favours, or at least good will, from those he never ght to be of the least importance to him. In such, in a multitude of other circumstances, one may the advantages of having been acquainted with the ›e of civility, which implies that one has given no ›cessary offence. There are other cases in which is called on by duty to do things disagreeable to elf, and exceedingly so to others. But there is no sense in performing such duty morosely, and with ›nanity.

POLITENESS—GOOD MANNERS.

›refined species of civility is sometimes expressed ›e term *politeness*, which is an exterior indication ››od breeding or good manners, and may be defined ›hat mode of behaviour, which not only gives no ›ce, but which affords agreeable sensations to our ›w-creatures. In our intercourse with the world, species of civility is imperative. We possess no ›t to give offence, by language or actions, to others; ›we are bound to conduct ourselves agreeable to ›reasonable and set rules of society. Some severe ›ers on morals have confounded *politeness* with *in›rity*. They seem to imagine that the act of speak›gracefully to another, is necessarily mere grimace, ›n empty flourish signifying nothing. In many in›ces, with insincere people, this may be the case, ›it is not so with those of well-regulated minds. It ›ways better to speak politely, that is, with extreme ›riety and delicacy, than coarsely, sulkily, or im››nently. We say, cultivate politeness of manner ›ll means, for it is *refined civility*, and will spare › ourselves and others much unnecessary pain. ›ivilised society has in the course of time instituted ›in rules in the code of politeness, which, though of › actual value, it is every one's duty to learn, be››e, by knowing and acting upon them, we can make ›glide on much more smoothly and pleasantly than ›e remained in ignorance of them. These rules are ››etimes called the rules of *etiquette*. We shall here ›ation a few of the more important of these social ›ulations:—

› *Honour to the female sex.*—Women are physically ››ker than men. They are unable to defend them››es from insult or injury, and it would be considered ›elicate for them to do so, even if they possessed the ››er. For these and other reasons, it is only simple ››teness and a sign of good sense to render any little ›vice to women—to assist them when they appear in ' difficulty, to speak respectfully of them and to ›n, and to give them honour whenever it can be ››nably required. It will be observed, therefore, in ›t is called good society, that women are treated ' exceeding delicacy and deference: they are of›d the best seat, or the only seat if there be no other; ››ed to walk next the wall, or at the farthest point from danger, in the street; never rudely jostled against in a crowded thoroughfare; and are always parted from with a respectful bow. All this is considered essential in good manners, and attention to it will not in the smallest degree degrade any man in the opinion of the world. At the same time, as respects the women who receive these attentions, it is expected that they will not "give themselves foolish airs," or presume on the forbearance and kindness of the stronger sex. In fact, no female will do so who is acquainted with good manners, or wishes to avoid being despised.

2. *General courtesy and respect.*—It is incumbent on every one to be courteous or respectful in his intercourse with neighbours, acquaintances, or with the public generally. To inferiors, speak kindly and considerately, so as to relieve them from any feeling of being beneath you in circumstances; to equals be plain and unaffected in manner; and to superiors, show becoming respect, without, however, descending to subserviency or meanness. In short, act a manly, courteous, and inoffensive part in all the situations in life in which you may be placed. Society, for good and sufficient reasons, which it is needless here to explain, has ordained certain modes of address, and certain exterior signs of respectfulness, which it behoves us to support and personally attend to. In eastern countries, as of old, it is the custom to uncover the feet and to sit down, in token of respect, on going into the presence of kings, or on entering any religious edifice or private dwelling. In our country, the custom is entirely the reverse. It is an established mark of respect to uncover the head and to stand, in the situations which we have mentioned, and to this point of etiquette we are bound to adhere. We must not, from any crotchet of our own, violate the rules or customs which society sanctions and enjoins, as long as these rules and customs are not opposed to reason and sound morals, and only refer to such trivial arrangements as taking off our hat, making a bow, shaking hands, or other matters equally unworthy of deliberate consideration. None but persons of a silly, eccentric turn of mind, think of disputing about these trifles. On the same principle, give every one the title, which, by law or courtesy, he usually receives.

3. *Personal behaviour.*—A well-bred man is always known by the perfect ease and tranquillity of his manner. These are points to be carefully cultivated. Acquire, if possible, an easy confidence in speaking, so as never to appear abashed or confused, taking care, however, not to fall into the opposite error of forwardness or presumption. Persons moving in the highest circles of society never allow themselves to appear disturbed or vexed, whatever occurs to annoy them. Perhaps there may be an affectation of indifference in this; still their conduct is worth admiring, for every thing like fidgetiness or boisterousness of manner is disagreeable to all who witness it.

Carefully avoid the following things in personal behaviour:—Loose and harsh speaking; making noises in eating or drinking; leaning awkwardly when sitting; rattling with knives and forks at table; starting up suddenly, and going unceremoniously out of the room; tossing any thing from you with affected contempt or indifference; taking any thing without thanking the giver; standing in the way when there is scarcely room to pass; going before any one who is looking at a picture or any other object; pushing against any one without begging pardon for the unintentional rudeness; taking possession of a seat in a coach, theatre, or place of public meeting, which you are informed belongs to another; intruding your opinions where they are not wanted, or where they would give offence; leaving acquaintances in the street, or a private company, without bidding them good-bye, or at least making a bow to express a kindly farewell; slapping any one familiarly on the shoulder or arm; interrupting any one who is conversing with you; telling long and tiresome stories; whispering in company; making remarks on the dress of those about you, or upon things in the room; flatly

bad manners, but these will be sufficient to illustrate the principle of politeness, and if that be understood, there can be no difficulty in knowing how to act with delicacy and discretion in all the concerns of life.

4. *Gentility and vulgarity.*—By attention to the rules of good breeding, such as we have just alluded to, the poorest man will be entitled to the character of a *gentleman*, and by inattention to them the most wealthy individual will be essentially *vulgar*. Vulgarity signifies coarseness or indelicacy of manner, and is not necessarily associated with poverty or lowliness of condition. Thus, an operative artisan may be a gentleman, and worthy of our particular esteem; while an opulent merchant may be only a vulgar clown, with whom it is impossible to be on terms of friendly intercourse. Vulgarity of manner is often exhibited, in its most offensive form, by persons originally of humble birth and breeding, who have risen to wealth by the force of fortuitous circumstances. It is not uncommon to hear persons of this class, particularly "ladies," speaking of "my coach," "my house," "my governess," "my family," "my servants," "my furniture," and so forth: all which is *pure vulgarity*, and indicates a low tone of breeding, and weak understanding on the part of the speaker. A man or woman of refined taste never alludes to matters of dress, domestic convenience, or things strictly personal, and rather endeavours to direct conversation into those channels in which all may harmoniously join.*

ANGER.

One of the most important of our private duties is the due regulation of the passions. We naturally possess certain mental affections called *propensities*, which, when properly restrained, serve a good purpose, both individually and socially, but when let loose, or badly regulated by the understanding, lead to the commission of many vicious and abominable actions, which in moments of calm reflection, and when our conscience is aroused, we deeply lament and regret. Irritability of temper, as demonstrated in the passion of anger, is one of the most unhappy of these derangements of our intellect.

The causes of anger are supposed to be these:—First, by the law of nature and of society, every one has rights

the least that can happen to one
acting, is, that he is preparing for
reproach and of bitterness. If no
that he was violently angry himself
in seeing others so, it must be
anger is contrary to natural law,
to divine law. It is an abuse of
us to promote our own welfare.

It is consistent with reason for
the influence of anger, to be prepa
the question, whether the wrong is
and whether he is himself free fro
of having occasioned, by his own
regards as a wrong. If the offen
tions arise, of this nature: What r

t manner, no one, perhaps, ever perfectly at-
out it cannot be doubted that there is some such
d. He who comes the nearest to it is he who is
titled to entertain a respect for himself.

PRIDE.

e is a kind of pride which is often mistaken for
ect. We hear of honourable and of laudable
We take pride to be that self-esteem in which
holds himself. It may be founded in his esti-
of the qualities of his mind, in his attainments,
ssessions, in his strength, his beauty, his paren-
d descent. It may also be founded in a con-
ss of virtue, and of having faithfully done one's
all the relations of life. It seems to arise
rily from comparing one's self with other per-
If this be the right meaning of pride, it is very
lat it is not always a sentiment which entitles
respect himself. A man would be thought to
y unwise who should openly declare that he
himself, in comparison with other men, on ac-
f his wealth, his beauty, or his family connexion;
unwise, if he should declare his opinion of him-
e, that he was superior to other men in the gift
ral intellect, in the cultivation of it, or in the
e of the various virtues. The common sense of
d, founded in natural reason, does not approve
self-gratulation which rests on the accident of
f inheritance, or even on the acquisition of for-
one's own industry; nor does it approve of that
when founded on qualities which belong to the
nor even in the practice of the virtues, unless
nanifested in a certain manner. There must be,
very nature of things, some persons in every
nity, large or small, who are superior to others
e sources of self-esteem. In every city, town,
lage, in this nation, there are some persons who
possession of some of these causes of self-esteem
e comparative degree, and other persons who
e fewest or the least of them. Those who so use
dvantages as to entitle themselves to the esteem
rs, and who are acknowledged to be respectable
t use, may well be entitled to respect themselves
uch causes. Those who use them in such a
r as to announce the feeling of superiority over
and habitually to offend the watchful feeling of
e, are properly called *the proud*. It is believed
ese views conform to natural law, and to the
ary constitution of human society.

VANITY.

ill greater mistake is made in substituting vanity
f-respect. The word vanity is made out of two
words which signify *exceeding emptiness*. It is
nly understood to mean a strong desire to be
, considered, and esteemed by others, but on
t of things rarely worthy of a rational mind.
ersons covet praise. They thrust themselves, and
which they value themselves, upon the notice
rs. They delight in recounting their achieve-
and sometimes make the sad blunder of speaking
se who know they are mistaken. They seem

adroitly on their own excellences, and provoke others to descant upon them. They have such delightful visions of self-complacency, that it seems cruel to disturb them. Such persons are very ready to become tools in the hands of more knowing persons. In general, the display of this poor passion is made by persons of very light and frivolous minds. It is seen at all ages, but strikingly in youth. To see a young person strutting or mincing along in a new garment, or in some personal ornament, and watching to see if he is noticed, and by whom, excites a feeling of pity and contempt. The same feeling arises when young persons are seen, who say in their movements, as intelligibly as though they spoke in plain English, "Do they not think me very handsome—elegantly dressed—a charming figure—most exceedingly graceful!" In some instances lookers-on do think so, and smile contemptuously at the same time. But, in general, lookers-on see no such thing as the vain imagine; they do see that which it would be shocking to those votaries of vanity to know *is* seen. They do see talents wasted, time misspent, foolish hopes, and vain desires. They do see that the purposes of life are misunderstood or perverted. Is there any remedy for these follies? None, probably, unless one would bring home to the minds of the vain, that they violate the strongest precept laid down in the code of natural law for the government of persons individually and socially. That precept commands them so to conduct themselves in all things, as to entitle themselves to self-respect, and, consequently, to the respect of others. If the vain could conceive how small a portion they make of created being, how insignificant a part they make of civilised society, how many there are in that society, whose pretensions, if asserted, would be transcendently superior to their own, they might, perhaps, dismiss their little vanities, and devote themselves to gratifications worthy of their intended nature.

GRATITUDE AND INGRATITUDE.

If a destitute young person should attract the notice of a wealthy man, and should be by him supported, educated, and established in the world, so as to be able to live, to become independent and respectable, every one would say that this is a case for the feeling and the expression of fervent gratitude. Let us suppose that the patron of this young man frequently reminds him of his former condition, and by what means he finds himself where he is. Suppose the patron exacts a frequent acknowledgment of his bounty, and takes to himself unqualified praise for his goodness. Let us suppose that the obliged party finds his condition very irksome, and almost wishes that he had never been the subject of such burdensome favour, and is at length provoked to say so—*is he ungrateful?* It would seem, then, that gratitude had two sides to it, as well as two parties. He who has conferred a favour has not done all which it concerns him to do; and he who receives a favour may have a difficult task to perform. A bargain is an exchange of one thing for another, and the parties are even. The conferring of favours, whether these be asked for or not, seems to stand on very different grounds. Many elements make up that compound from which gratitude is said to arise. The parties may understand the nature of the favour very differently at the time when it is conferred, and more differently afterwards. He who confers, has a retentive memory; he who receives, a fading one: time engraves the favour deeper and deeper in the former, and wears it out more and more in the latter. In the former it often preserves the freshness of a new occurrence; in the latter the sense of favour often goes, and the weight of obligation alone remains. It may be that the complaints made against ungrateful persons are not always well founded, and that the expectations of those who confer favours are as little so. Some poet has written,

> He that's ungrateful has an only fault—
> All other crimes may pass for virtues in him.

The meaning of this couplet must be, that the members of society are under no obligations to confer [illegible] and that, if they do confer them, the party ob[liged] monster if he do not—*what?* We know no[t] intended, nor that there is any rule by which [it] is to be manifested. We think that every m[an] society is to do what of good he can, and to wh[om] stands in need of it. He is not to stop to mea[sure] calculate how he is to be paid for it. He m[ust] paid by the party benefited directly, but by so[me] and in some other and unexpected way. W[hen] confers favours, opens an account with the cha[nce] chances and accidents of life. His credit sid[e] well in the close. If he confer a favour, b[ut] because he thinks he can and ought to do it. the *pleasure* of doing it. If he wishes to a[void] affliction of ingratitude, he has only to avoid le[ading] party obliged know, unnecessarily, whence th[at] comes. When a favour is done, the party co[nfers] it takes on himself the duty of respecting th[e] of the human heart which is founded in reason love, and which is entitled to respect—that is, t[o] *one who has had the misfortune to be bound* is t[o] *clank them for the gratification of him who put* There are cases of extreme ingratitude. T[hey] have been occasioned by the irritating or i[nsulting] conduct of the party who was entitled to a return. They are not of common occurrence they do occur, uncaused, the disappointed p[erson] hope to find a better subject in his next essay

SLANDER.

This is a twofold crime: 1. It is a breach o[f] law, of divine law, and of the implied law of s[ociety] relation to the party spoken of; 2. It is a b[reach] the same law, in relation to the party speaking been commonly treated of in the first relation now to be noticed in the second; and if it b[e] why it is a breach in this, the other will ma[nifest] itself. We beg leave to ask a slanderer a few qu[estions] Do you desire to be esteemed in society for yo[ur] ligence, your sense of justice, your knowledg decencies of life, and for the observance of th[ese] you happen to be ill-tempered, petulant, and d[is]able to your family connexions and associates make hasty and troublesome judgments, which y[ou] to rescind or reform; if you happen to be ridic[ulous] your deportment, and remarkable for silly vani[ty] you willing to have these things set forth in a[n] every company, by any one who knows a[ll] Suppose there to be only some slight foundat[ion] some one or more of these things, which, if yo[u] have an opportunity to explain, would be c[learly] cleared up, are you willing to have that slight fou[ndation] made the basis of a structure of reproach, w[hich] true and real, ought to expel you from decent s[ociety] Suppose there to be no foundation at all for a[ny] accusation of yourself, and yet somehow, a[s] accountably, it is afloat and circulating, should y[ou] think great injustice to be done to you! This [is] what you do to others. You take away the name, if they deserve to have one; you magnif[y] little faults and errors, and make them ridicu[lous] odious; you try them on indictments for serious c[rimes] on which they have no opportunity to defend themselves, and of which they are ignorant. Wha[t] you get your information? What credit were entitled to from whom you had it? Did you unde[r]stand them as they meant to be understood? Who[m] how did your informants learn what they com[mu]cated? Were they thoughtless or malicious slan[derers] like yourself? How much have you added to slanders by way of recommending and making y[our] agreeable? Have you broken any law by this co[n]duct? We take the liberty to answer for you.

You have broken every law which an hon[est] honourable man, and a rational individual, [is] respect. 1. You have made every person who [you] have spoken to, fear you and shun you. Y[ou] shown that you know not what the value of [a]

is, and have forfeited your own, if you ever had

You have shown that you are a stranger to self- et; that you have probably every one of the faults, s, and errors, which you impute to others; and e to bring them down to your own level. Thus ave broken that law which commands you to do il to yourself. 2. You have violated that principle ural law which commands you to do no injustice ar fellow-men. You know not what opinions you ntertain of the party you have slandered, if cir- ances (as they may) should bring you into con- n with him. You may find him to be, on a better ledge of him, an amiable and worthy person. You nd all that you have said, and helped to circulate, y groundless. If he be one whom you occasionally , and even ask to partake of your hospitality, how you meet him, and manifest towards him every ment of respect and esteem, when you have so n of him? One of two things must be true: r you *act a lie*, when you meet him in such a man- or you *spoke a lie*, when you represented him as id to others. 3. You have broken the law of God. is law, perhaps, you are a stranger, and know not . wrong you have done. If so, the kindest thing any one can do you is, to urge you to find out what and to learn there the sentence of the slanderer.

may be asked, whether one is to be entirely silent l times, and on all occasions, as to the character conduct of others? Certainly not. There are y occasions for speaking of others, and for speak- he *truth* of them, whatever that may be. All the bers of any community are interested in knowing rue character of each other. The knowledge that character may be known, is one of the most salu- correctives of erroneous conduct, and one of the gest inducements to pursue that which is com- dable. It is probably the case, that the members very community are pretty well understood by all have an interest in knowing them. We know not ny law which holds it to be immoral *to speak the h of any one, from good motives, and for justifiable s*. It is all-important that this principle should pre- in our country, where so much depends on public ion. Surely one's arms are not to be folded, and lips closed, when he sees one bent on mischief, pub- or private. It may be one of the highest moral s to declare what men are, and what they are ing at, in many supposable cases. There can be no r guide than the *motive* and the *end*. Inquiries are times made, in matters of greater or less interest, erning others, confidentially, and where the in- er needs to be truly informed. The party inquired s a right to be silent, if he thinks he has good n to be so; but if he answer, he is bound to state ruth. If he choose to speak, and wilfully conceal ruth, so that the inquirer is deceived, he subjects elf to the imputation of an intentional deceiver. ere may be also, and there frequently are, con- tial discussions of character, especially concerning e men, and where perhaps there is no particular n view. This does not seem to be wrong; such course is not founded in malicious or unworthy es. It is even sometimes instructive and philo- cal. This, perhaps, is the extreme limit. In all imaginable cases, it is probably most consistent one's own self-respect, and all truly respectable es, to let other persons alone, and leave to them are of their own characters.

PROFANITY.

cepting the high crimes which are punishable by ublic laws, there is no one so shocking as *profanity*, ny one which there is so little inducement to com-

Profane swearing is of two kinds: 1. That in h the Deity is called on to do the pleasure of a ng mortal; 2. That in which the Deity is called on itness the truth of such a being's thoughtless or ed declarations. This common practice can be unted for chiefly on two grounds: 1. Pitiable igno- rance; 2. Abominable wickedness. On the first ground, surely the profane swearer must be ignorant of the import of the terms which he uses. If he did understand his own words, he would be struck with horror. Surely, if there be any escape for the profane from that condemnation which they imprecate on others, it must be, that mercy will be extended to them in compassion for their ignorance. On the other hand, if they are not ignorant, but do knowingly and wilfully so misuse the gift of an immortal mind, and that unquestionable proof of Divine power and goodness, *the ability to speak*, they cannot be subjects of moral instruction. They should be left, like the consumers of alcohol and tobacco, to shock and to warn others.

Swearing, which formerly pervaded every rank of society, is now to be chiefly found in a very low and uninstructed class: it is, in fact, a vulgar and proscribed mode of speech. Nevertheless, it is still used occasionally by persons of no humble rank, especially by the young, though chiefly for the purpose of giving an emphasis to speech, or perhaps simply to give token of a redundancy of spirits, and a high state of excitement. To those who are guilty of it for these reasons, it is only necessary to point out, that no well-informed person can be at the least loss, with the genuine words of the English language, to express all legitimate ideas and feelings, and that to use either profane or slang words, is, at the very least, the indication of a low taste and an inferior understanding. A direct, pure, manly use of our native language, is an object which all may cultivate in a greater or less degree; and we have invariably observed, through life, that the most virtuous persons are the most exempt from the use of mean and ridiculous phraseology, and monkey tricks of all kinds.

Does not one who is habitually profane, necessarily entertain a low opinion of himself? Would any respectable merchant, or mechanic, or farmer, receive into his service a youth whom he knew to be a profane swearer? Could any one who is known to be such, find admission into any school, academy, seminary, or college? Would any respectable parent admit such an one to be a companion of his children, or a visitant in his family? Would not every reasoning person say, that a youth who is so ignorant as not to know that swearing is a violation of natural and divine law, must be ignorant enough not to know that there are many other laws for the proper government of society, and consequently that he is an unsafe person to be trusted? If the profanity be the consequence of voluntary wickedness, then surely all reflecting persons would say, that he who is wicked in this respect, is indeed wicked; but then he will be wicked in others also. For, as there is one chain which runs through all the virtues, and binds them in a sympathetic union, so also is there a chain which unites all the vices. He who swears, may be justly suspected of drinking; he who swears and drinks, may be justly suspected of gaming; he who swears, and drinks, and games, must keep very bad company by day and by night. He who keeps such company from such motives, must squander his own property, or steal that of somebody else to expend. He who robs another will commit forgery, and he who is so desperate as to commit these two latter crimes, will not hesitate long to put a human being out of the way of his pressing wants, if he is tempted to do it. It is probable that habitual lying and swearing are the first steps in that mournful series of crimes, and the first beginnings in the course of deplorable wretchedness, which deform and disgrace human society. Will any one maintain that these are necessary evils, and that God has so made man that they cannot be prevented? Surely these are evils wholly of human origin; and where they begin, there lies the power to extirpate them.

ENVY.

It is to be kept in view, that the main object is to show that this is a good sort of existence, if man knew how to use it, and that he is the author of his own af-

principle of action, he would see, probably, the most operative cause of the misery which men inflict upon them-selves and on each other. If one has not time to read history, and watch his fellow-men, he may perhaps learn much of what he would find in these authorities, by *reading his own heart.*

The word envy comes from two Latin words, *in* and *vidio*, and signifies *looking against.* It arises from perceiving in other persons, qualities which one's own self-love leads him to wish to have—as beauty, strength, grace, learning, eloquence, power, &c. It extends to riches, to office, to distinction, to the respect and esteem in which one is held by his fellow-men, and even to birth and ancestry. It makes one *sorry* that he has not these good things, and makes him *angry* that others have them. One easily persuades himself that great injustice is done to him, in that *he* has them not. The next step is to *hate* him who has them. Then comes the desire to deprive the supposed fortunate possessor of the benefit of them. But to admit that one has these malignant promptings, is contrary to another principle of self-love; and therefore no man tells another of his own envy, and he tries to wrap it up from his own view. As he cannot and dare not openly manifest that he is envious, he must obey the suggestions of malice in the dark. He therefore intrigues, insinuates, and becomes adroit in putting one thing for another; he secretly and by covert means undermines the object of his hatred. He whispers his doubts, suspicions, opinions, and belief. If the tenure of the hated object is too strong to be shaken, then the bad use which he makes of his advantages are sought out. The base accompaniments of his fine qualities are brought forth, and placed in the strongest light. "She is beautiful; *but* she is vain, haughty, and silly. He is rich; *but* he got his wealth by frauds, and hoards it like a miser. He is able, eloquent, and popular; *but* he is selfish and insincere, and would put a yoke on every neck in the country if he could. He is making a great flourish in the world; *but* it is all false and hollow—he came from nothing, and will go back to nothing." It may be easily inferred that one who has surrendered himself to the dominion of envy, not only deprives himself of the profitable use of what he has or might have, but makes himself wretched in contemplating what he must know he cannot have: he would descend, until the scrimmary place for even envy to find somethin

Is not this a fair example of what in all grades and classes of social lif passion of envy, earth-born, mischie What is the remedy? Common sens point out the remedy. Generally member in society is just as much i he is in his own skin. No one ca place. Every one has his place ori him, and his natural condition in which he had no control, and in ma no agency. What he will make out the circumstances in which he fin depend (after the irresponsible state o on his own thoughts, motives, and his greatest good, not in repining at (which he can never make to be his cannot destroy without expecting re to himself), but in making his own c he can, consistently with self-respect That which is given to others, and lawfully acquire, is righteously their given to one's self, and all that he like manner his own. If he would done to him by those who are below no injustice to those who are above h no doubt that the day will come whe instructed, and men so self-discipline the laws of nature, and the laws of formable to these, permit to every place, enjoin duties in that place, and from the performance of those duties comes, envy will die.

EMULATION.

This has been sometimes classed w have nothing in common. One woul in being known to be envious, but praise to himself in being emulous. action was given to man for the best and upon the application of it, with and to commendable ends, the advan welfare mainly depends. We under the desire to obtain excellence in

have been trying to show what peace of mind is
We have to show what it is, or rather in what it
ded. It comes from sober conviction that the
r has made his own laws for his own universe;
e requires conformity to these laws; that he per-
nd enjoins the use of what is good and right;
e punishes all that is wrong and mischievous.
e trusted every mortal with his own welfare, with

with the means of purchasing a precious name; they would learn that no wealth will exempt any man from earning an appetite for his pleasures by physical motion; that, if he is tired of being rich and happy, *he must work* to accomplish some reasonable purpose. His distinction is, that he may choose the means in which he will expend *to be busy*, while others can only work in some prescribed mode *to live*.

The middle classes, and all who are not dependently poor, have as many and as valuable sources of enjoyment as those have whom they think to be better off than themselves. They can love and be loved; they can be respected and esteemed; they can have the consciousness of behaving well, where their lot has been cast; they have a far keener zest for natural and reasonable pleasure than those who misuse the bounties of accidental condition; they can have peace of mind when it is denied to those whom they deem more fortunate. If these natural laws, which seem to be so plain and obvious, were understood and respected, the labourers *in mind*, in all their varied employments, would do diligently, and in the best manner in their power, that which they have undertaken. Men of public trust would do honestly, and with a single view to their trust, that which they have undertaken. Suppose it were all so, and yet troubles and disappointments come. This may be, and yet there would be peace of mind. If every one were assured that no act, no omission of his own, makes him suffer, that he has acted faithfully and honestly, and to the best of his ability, in the circumstances in which he was placed, he would be entitled to have, and by the law of immutable justice, he would have, *peace of mind*.

HAPPINESS.

There is no word in our language more commonly used, nor any one less defined or less understood. It is sometimes taken to mean pleasurable sensations derived through the senses; sometimes it means a peculiar state of mind. It may be said that a pirate who has been brought to the most perfect penitence, and who is sensible that he has forfeited his life to the demands of justice, and that he is about to be transferred from the perplexities and sufferings of this state of being to endless felicity, is *happy* that he is going to be *hanged*. Perhaps it is easier to tell what happiness

TIES OF LIFE.

ves aggrieved by oppressive state measures, they
eedingly apt to break into tumults, and take up
gainst the officers of their governments. This is
shortsighted policy, as the history of all nations
; for the people are always sure to suffer far
the coercive measures adopted to restrain them
ey would have done by submitting to the evil
iginally complained of. It is the boast and glory
in—and long may it be so—that its people know
respect the laws, even while they consider them
jurious, and how to correct them by quiet and
procedure. In this lies the important secret
national greatness, their wealth, their public

The advantages arising out of a scrupulous
ce to the laws, consist, in the first place, of social
nd quietude, by which the rights of property are
ed, commerce and trade permitted to flourish,
sacred inviolability of the person preserved. The
of turbulence and civil commotion are, poverty,
property, insecurity of the person, destruction
nerce and trade, and at length, military oppres-
l barbarism. Every intelligent man, therefore,
country, yields not only a bare submission but
ing respect to the laws, as well as to the various
ions established by their authority.

ct obedience both to the letter and the spirit of
s, does not, however, imply that we should not
e whether they are in every respect answerable
present condition of society, nor keep us from
g to legal means to have them corrected, or
er rescinded. The constitution points out how
o be done. It is illegal to conspire secretly to
ow the law. All measures calculated to improve
ial condition must be conducted openly and
ably. The means put into our hands by the
tion for improving the law are very powerful,
led with discretion. The people have the ap-
nt of the men who constitute the most influential
of the legislature; if they do not appoint indi-
who will meet their views with regard to mor-
or abolishing laws, they have themselves to
the constitution confers upon them a liberty of

It besides gives them the right to present peti-
the legislature, either individually or in bodies,
in respectful terms for the amendment or
n of any law which is deemed oppressive or
ted. This right gives a vast addition to the
f the people. It is of much greater value than
uld at first be inclined to suppose, and is infi-
referable to the use of violence. The right of
implies the right of meeting publicly to discuss
priety of petitioning. This practice of meeting
r excites the public mind to renewed efforts in
se it undertakes. The speeches of the orators
ulated and commented upon by the newspapers
the country. One meeting gives rise to others,

men's minds are enlightened and warmed, and the public opinion acquires a degree of moral force, any resistance to which would be useless. It is not without reason, therefore, that the people of this country set so high a value on the right to assemble for the discussion of public affairs, and place it in the first rank of their constitutional prerogatives.

Besides yielding obedience to the existing laws, we are under a collateral obligation to be loyal to the sovereign who rules over us. Loyalty is hence another of our chief public duties. There is some difference of opinion with regard to what extent loyalty ought to be carried. It appears to us that this is a simple matter. A power to protect the nation from foreign insult, and to preserve the internal peace of the country, *must be lodged somewhere*. It is found to be most convenient to lodge it in the hands of one person, under proper restrictions. In Great Britain, as will be seen in our history of that country, it has been placed in the possession of a hereditary prince or king. This person is entitled our ruler or sovereign; we are termed his subjects. Loyalty signifies a fidelity and willingness in serving the king, so that he may be enabled both to protect the nation from outward harm, and to preserve order in society, through the agency of the laws, or, failing them, through the application of force. Seeing that the sovereign is prevented by the constitution from infringing upon the rights of the subject, through the exercise of his power, it is discovered that loyalty is rewarded in the comfort we enjoy; or, to use another expression, self-interest alone, if no nobler sentiment interfere, would lead us to afford assistance to the king in the execution of his high and important trust. This assistance is demonstrated, not only by personal service, if necessary, but by respect. Loyalty may be greatly enhanced by esteem for the private virtues and conduct of the sovereign. When so influenced, it is certainly both an amiable and commendable feeling, and can never, but in ill-regulated minds, degenerate into servile prostration.

In the United States of America, in which the executive is lodged in an elective president, the people call themselves citizens, not subjects; and what we mean by loyalty to the sovereign, they term duty to the commonwealth. It is obvious that there is extremely little essential difference, *practically*, between these phrases, whatever there may be in *feeling*. The subjects of Great Britain are as free as any people in the civilised world; much freer, indeed, than the inhabitants of France, who disclaim the appellation of *subjects*. These explanations are perhaps useful in admonishing us to beware how we vex ourselves about mere words and sounds. Our duty clearly consists in appreciating the numerous blessings we enjoy in our public and private relations, by whatever name these relations may be called. We are each individually fractional parts of a great nation, whose honour we are called on to sustain through good and bad report. Let us remember that individual virtue can alone promote social happiness, and that social happiness and peace form the basis of political independence. No man can be a good and respectable subject or citizen who is a bad son, a bad husband, a bad father, or a bad master. The nation is but a composition of a great many families, knit together by kindred sentiments and mutual wants; and how can it be great, or worthy of esteem, if its component parts exhibit in their constitution the worst of vices!

Loyalty to the sovereign leads to a subordinate but important duty. It induces us to respect inferior constituted authorities. All judges, magistrates, or other civil functionaries, stand in the light of representatives of the sovereign. The king cannot be every where at once, and he deputes these individuals to attend to the wants of his subjects, and to keep good order in society. To show contempt for any court of justice, or for any magistrate, is, therefore, equivalent to showing contempt for the king himself, as well as for the laws, and is justly punishable. To show our respect both for the laws and the sovereign, we must respect the decisions of judges and magistrates, and support their due exec our personal influence. Nevertheless, it is one's power, when they feel themselves aggri these decisions, to appeal to higher authorit dress; such being the only means allowable constitution, in opposing the legal power of t blished courts of civil and criminal jurisprude

A becoming obedience to the laws, and a g respect for the supreme and inferior constitut rities, produces the agreeable result of good or peace in society. Every one is not acquainted different ramifications of the common and stat indeed it would be impossible for us to acquire knowledge of these things unless we devoted a to the study. This difficulty in acquiring a kn of the laws, has sometimes given rise to a lo jeering at our excellent constitution, and it represented as cruel to compel an obedience which few can have an opportunity of learni this is a fallacy into which we hope our young will not fall. The administration of the com such as that which applies to inheritance, deb creditor, and civil rights generally, rests with of educated men, or lawyers, whose services m times be commanded. Besides, we may, if w purchase digests of these laws for our private ment and instruction. The other description which is made applicable to the preservation peace of society, any one can understand, if the ability to know right from wrong. We k know that it is illegal and criminal to steal, t murder, to break into our neighbours' house attack their persons by violence. It can re reading of acts of Parliament to understand th mon sense here serves us instead of legal kno Our duty in this matter is very easily defin must ever bear in mind that one of the prim of duty which the constitution enforces, is the ing from meddling violently with the persons perty of our fellow-subjects. In this well-re realm, the person of every man, woman, and inviolable from private attack. It is a crime punishable with the highest penalty of the law, t any one, either from an idea that they have inj or through the influence of passion and preju we consider that we have been injured, we mu to the law or the magisterial authorities for We are only permitted to use physical force absolute danger of losing our lives or property lence, there being then no time to apply to the protection. It would be gratifying if these re were more generally attended to than they are There are many young men, who, from what pleased to term a love of fun, but which can be sentiment than a love of mischief, or gross ig assail the persons of individuals of both sexes, great discomfort, and sometimes serious injur it is clearly illegal to do so, and is generally by the infliction of severe penalties by the civ trate, though seldom marked with that ignomi it deserves. Inasmuch as it is held that ign the law does not excuse its infraction, so is it an invalid apology for the commission of cri that you were under the influence of intoxicati time. Drunkenness is very properly esteemed vation, not a palliation, of the offence.

CONDUCT AT PUBLIC MEETINGS.

The right of meeting together publicly matters connected with our social condition, invaluable a prerogative, it is right and fittin young men entering into the busy scenes of li make themselves well acquainted with the ru

* At the same time, we willingly allow that there great improvement in the dissemination of a knowle statute law, particularly that of a recent date. It is some plan will soon be carried into execution, to re defect.

rity carrying. If the votes be equal in number, ting-vote of the chairman carries. There is an- way of suppressing a resolution, which is by g the previous question.' This signifies, to to the point at which the business of the meeting revious to the tabling of the motion; or means, r words, to do nothing on the subject. But this be seconded, and put to the vote in opposition to the motion or amendment, or to both. The is generally to place it in opposition to both; if , the matter is settled; if not carried, the order to place the motion and amendment against each and vote.

is an outline of the mode of procedure at public gs, and it is particularly desirable that attention be shown to the preservation of regularity. At lic meetings there is a strong tendency "to go order." By this expression it is meant that e are under a constant liability to wander from nt under discussion. They are apt to digress her subjects, and confuse their auditors; and getting impatient, are equally apt to interrupt so that a single irrelevant observation may lead s of idle debate or colloquy, or "speaking to " as it is termed, and thus the harmony of the ly be destroyed. Those who attend such meet- ould therefore have a regard for the following tions:—If they speak, they should keep closely ubject in hand. If they be listeners, they should to a strict silence. It is ungentlemanly, not to orderly, to utter any sound or make any observ- on what a speaker is saying. The speaker must account be interrupted, so long as he keeps to and if not in order, it is the chairman's duty to him. It is likewise disorderly to speak more ce, except in replying before the vote is put, or it be the rule of the assembly to permit it. mes persons who have spoken rise again to speak "a matter of form." This is allowable, but in g as to form, the merits of the case should not oduced. On this, however, as on every other there is a perpetual tendency to go out of order, nce the absolute necessity for appointing a chair- ell acquainted with the forms of public deliber- nd who has the strength of mind to insist on being preserved.

ll our public assemblages, a certain degree of y is used both among speakers and listeners. individual rising to speak, he addresses himself to the chairman, and the chairman in return mentions the name of the speaker; by which the audience is made acquainted with the gentle- he is about to address them. When the discus- f the meeting are over, the chairman closes the s with a few observations, and then dissolves the dy by leaving the chair. When any dispute in the course of the business of the meeting upon of form, it is customary to appeal to the usages House of Commons for an example to be followed.

DUTIES AS ELECTORS.

re are duties of another nature which we may be on to perform in our character of citizens. We ested with the high and solemn trust of electing presentatives in Parliament, as well as represen- in our municipal institutions. In the execution duty as electors, we are bound to divest ourselves factious or personal considerations. We have dly to consult our own good in making a choice presentative, but it is only as flowing from the f the *whole* community. We must hence act y without passion or prejudice. Let us examine vious habits of life, public conduct, and avowed ents, of candidates, and calmly consider whether m such as we can approve of, or as being con- with the general welfare of the people. We also recollect that we exercise the trust of s far many who do not possess that privilege. e proportion of the community consists of women

and children, persons in an humble condition, the sick, and the helpless. These look to us for protection from wrong, and it is our duty to afford it to them. If we, therefore, act with levity and imprudence in appointing men, who, from their conduct and character, are unfitted to exercise the important function of public representatives, we in more ways than one commit a crime against society, and are unworthy of possessing the valuable prerogatives with which the constitution has invested us.

In our capacity as citizens, we are frequently called upon to elect representatives in different municipal bodies; such as civic managers of the city in which we reside, managers of local trusts—general, political, and religious. There is often much heat at such elections; a petty factious spirit frequently governs the choice which is made: sometimes the meanest passions of our nature are exhibited during the contest. The observations we have made on our duties as electors generally, apply here with peculiar force. As those who present themselves as candidates live amongst us, we can never find any difficulty in estimating their character and qualifications. But we must take care not to be borne away by private feelings; we must not give our vote simply because the candidate is an acquaintance. A consideration for *what is best for the public interest* should in every case govern us; and we should not be afraid to let these our sentiments be known, for they can give no honourable man offence. In all cases of elections of members of civic corporations, and such like bodies, the chief merit in electors, after that of good and respectable character, is soundness of judgment, and after that, activity of habits. The power of fine speaking, or eloquence, is not required in such a functionary, and should be esteemed very lightly. That which is required is a power of thinking coolly, an integrity of purpose, and a willingness and ability in taking a share of the burdensome duties to be performed. Our qualifications as electors, perhaps, render us liable to be ourselves elected. In the event, therefore, of being called forward by our fellow-citizens to fill the honourable situation of their representative, it is our duty to sacrifice perhaps our own feelings and a portion of our time in the public service, provided we conscientiously consider ourselves qualified for the task, and that our health and private circumstances permit it. The principal question we have to put to ourselves, when we are so brought forward, is, "Have we sufficient time to spare to attend the various meetings—to sit and deliberate in the numerous committees—to have our minds frequently occupied with public affairs?" If we deceive ourselves in answering this important question, we wrong society, and give ourselves cause for much after disquietude. Is it, or not, the proper way for every one who is worthy of this trust, calmly, deliberately, and to the best of his knowledge and belief, to do those acts which will best preserve for his own use the beautiful fabric of our political institutions? If he perceives and rejoices in the good which he and others derive from it, will he not best perform his duties to those who come after him, to use it, and not abuse it, that they may have the like good? Little suggestions of selfishness, rivalry, and petty local interests, and, most of all, perverted and mischievous ambition, are the blocks over which citizens stumble and fall, in the otherwise luminous and clear path in which they are permitted to move.

DUTIES AS JURORS.

The laws under which we live give us the invaluable privilege of trial by jury; in other words, we are tried for the commission of offences by a body of men chosen indiscriminately, as nearly as convenient, from the class of society in which we have moved. By such a considerate regulation, there can be little risk of individual oppression, provided those who compose juries do their duty. It is therefore incumbent on citizens who are *liable to* serve in juries, to make themselves acquainted *with what is* understood to be their duty when so called upon. It requires no learning to fulfil the of a juror. It requires no more than a thinking, and a mind above being carried prejudices or feelings. The juror is to rem it is the jury which is the judge in the ca judges who sit on the bench. Keeping this in one of the chief qualities requisite in a jury its proper dignity and honour inviolate, an with all courtesy, and to act with firmness in tion of its important function. Besides d dispassionately on the evidence presented, duty of the juror to be totally regardless of sideration but that of strict justice. He is regard the rank of life of the culprit, nor of t party. In a court of jurisprudence all men equality. It is also the duty of the juror, afte his conscientious opinion, not to be coerced, or or spoken into a different opinion. He is inv a solemn trust, and that trust he must pres scrupulous care, as consonant with the dearest of society.

DUTIES AS NEIGHBOURS.

Besides the duties which we have to per members of a great nation, we have duties of a nature to perform as inhabitants of a town, or neighbourhood, and in relation to which w times receive the appellation of citizens. Every belongs to a neighbourhood, which is both i social. Even those who have removed into re tries, and who dwell in solitary abodes, do not sentiment of neighbourhood. The nearest pe them is a neighbour, though separated by long And when this sentiment cannot be preserved it may be in thought, and by that means it c so. Perhaps the last impressions that leave t of one who has wandered into far distant reg those made in his early days, in his native ha general, as every one lives in a neighbourhood less dense, he can promote his own happiness, of those around him, by observing a becomi conduct. He has a right to enjoy life, and to things which he has, to that end; but he has no to any enjoyment which necessarily disturbs others. Peace, tranquillity, and security with own walls, is the main purpose of life. No on right to interfere in these things but by order public law. A neighbour, therefore, who so c himself, and those means of pleasure which mands, as to vex, harass, and disturb those necessarily within sight, hearing, &c., com offence against morality. It often happens t pleasure of one who dwells in a dense neighbo to keep one or more animals, whose habits disturb those who necessarily dwell within he the hours allotted to repose, and frequently w sons are visited by sickness, and when any distressing. Now, whatever the rigid law of may say in such cases, the law of morality s the suffering party has an unquestionable remove his trouble, if the proprietor of the such nuisance will not, on request, remove it A more peaceable way would be, to have it rem order of the public magistrate. Many of su nuisances ought to be removable on summar application, and not in the slow, written, and process, in which the movements of ordinary commonly made.

The moral duties of neighbourhood exten things which minister to the common comfor nience, and security. Each one of a neighbo bound to make his own dwelling-place as agre pleasant to those around him as he reasona Each one is morally held to uphold and sustai name for his own little community. He is, t to join, with a liberal and manly feeling, in a provements which tend to please and adorn things, even if they occasion some expendi sources of self-satisfaction; and one comes at l

nourable pride in hearing his street, his village, wn, or city, commended by observers.

ere is another sort of neighbourhood which is led in social intercourse, and in the interchange of ng and hospitality. As the world now is, this is only regulated by artificial and somewhat unnarules. It is often ostentatious, luxurious, and de- of all feelings and thoughts in which well-trained minds can take pleasure. A profuse and volupentertainment, comprising food little adapted to ote health and vigour, and in quantity sufficient en times the number, that rather look at than me it, is an unsatisfying way of being happy in intercourse. There are modes of maintaining such ourse, which are innocent, pleasing, and dutiful. kind are fitted for such. The interchange of friendly for conversation, music, and rational amusement, such things as may be used without suffering or ring health, is that kind of neighbourhood (in such ons) which is permitted and enjoined. We have, ver, little reason to think that intimacies of this are likely to meet with such consideration as would e the further extension of them.

ery person, in general, is a member of some kind iety or association. Some persons belong to many. e are intended for some useful purpose. Every one such member has some duties to perform. He some proper part of his time, some proper contri- , to the common object, and has an interest in rosperity of the design. All these institutions do good, and some of them eminent good, in helping e great purpose of social life, which is general im- ement. Of this nature are public charities, edu- al institutions, libraries, agricultural societies, and for suppressing intemperance and immorality. No -disposed citizen can conscientiously abstain from g his aid and support to such objects. It is each duty to try to leave the world a little better than und it. No one can say these are matters which ot concern him. Suppose every one should say so, had said so from the beginning, society would still ade up of barbarians. Every good that is done y community affects, directly or indirectly, every ber of it. The law of example, of imitation, of doing hers do, has a most pervading and astonishing in- ce. Every community is like a full vessel of water; e drop in it can be moved without affecting every r drop.

DUTIES IN OUR DOMESTIC RELATIONS.

Marriage.—This institution is agreeable to a law of re, and is an ordinance of the Creator. There are ligates who have doubted this; but they have ex- ed no reason on their side. It is obvious that man t only a gregarious, but a pairing animal. Marriage consistent with the finest of his feelings—the most le of his faculties. It began when man began. It dered to perpetuate the succession of the human ly. It is ordered for the whole duration of adult — It is man's peculiar privilege in this; it connects with generations which are gone, with that which ssing away, and with those which are to come. The mory and the ashes of the dead are precious to him, no other animal has that sentiment. He alone con- plates that his own memory will be held in honour, that the place of his earthly quiet will be sacred. only is enabled to conceive that moral and physical g will bear his own stamp in the character and in frame of those that follow him; he only knows that od name may be an honourable inheritance. These the sentiments which spring from the beneficent of marriage. However much one may misunder- d or abuse this gift, nature, ever faithful to her , forces these sentiments on the heart.

arriage is recognised as a contract of a binding e in all civilised nations. By some it is considered, its solemnity, to be of a sacred character; by it is deemed only a civil bond of connexion. All, ever, agree in holding it to be an irrevocable contract. The laws of the land, those of nature, and the divine law, disclose the sentiments, the feelings, and the awful sense of duty with which this undertaking should be regarded. Yet it is frequently entered into from motives highly reprehensible, and sometimes with shocking thoughtlessness. It is from such causes that we see that this sacred union, which should be the true source of the highest human happiness, becomes that inexhaustible fountain from which both parties are daily and hourly compelled to drink, and from the same cup, the bitterest waters.

In a great number of instances, marriage is contracted with exceedingly little regard to the qualities of the mind on either side, particularly on the side of the man. If one could penetrate the ear of an enamoured youth, some good might come from such suggestions as these:—Do you know what will come of that engagement which you are about to make? Are you about to tie yourself by bands, absolutely indissoluble while you live, to a mortal who has feelings, wishes, wants, hopes, and fears, which must become yours, and a part of your very self; or which you must resist, control, or contend with? Do you know that pain, suffering, and sorrow, originating in either, must be borne by both? Are you aware that whatsoever of error, folly, or crime, may be chargeable to either of you, or to any who may spring from your contract, will be your common burden and shame; and that from these you can relieve yourself nowhere but in the grave? Or, do you know that this attractive being will be your kind friend; your counsellor; the welcome soother of your cares and anxieties; the generous and charitable judge of your infirmities; the inspirer of honourable ambition; your fellow-labourer in joint interests; the ornament of your life; the gracious, considerate, faithful, gentle companion, who will make your own virtuous home the place to which you refer all earthly happiness? Who that is "in love" has leisure or inclination to think of such *trifles* as these?

There is no reason why the passion of love should be wrapped up in mystery, nor any why the mind should be stained in considering its nature. It would prevent much and complicated misery in the world, if all young persons understood it truly. There are in every human being seeds, each one of which may be made to germinate, and may be so cultivated as to produce the most odious vices or the most serene and heavenly virtues. There is in every human heart a fund of kindness, tenderness, and affection, which makes itself known to be there in due time. It demands to be applied. This is the trying and perilous moment in youthful life. There is some one, some where, who will take that fund, and give back its full equivalent. The external senses and the heart are in search of that one. Happy will it be for the searcher, if he will take reason as a monitor to keep the senses and heart in order. But reason is commonly regarded, not as a kind and faithful friend, whose duty it is to whisper, "begin nothing of which you have not well considered the end," but as a withered scowling matron, who, being utterly dead to the impulses of youth, denies that there ought to be any. If there has been no preparation for this eventful period; if the mind has not been enriched with the teachings of rational prudence; if the eye has not been taught to distinguish between the real and the fictitious; if the ear has not learned to discriminate the meaning of sounds; if life as a whole, if the consequences of irrevocable deeds be not thought of, there is peril; and the pure drop from the fountain may flow into any sea but that of happiness. In seeking for that being who is to be a companion during life, one grievous failing must be avoided. Young men frequently amuse themselves by playing with the feelings of young women. They visit them often, they walk with them, they pay them divers attentions, and after giving them an idea that they are attached to them, they either leave them, or, what is worse, never come to an explanation of their sentiments. This is to act the character of a *dangler*, a character truly infamous.

Young men cannot be too cautious in the attentions which they bestow on unmarried females, who on their part should be equally guarded in not encouraging the addresses of any individuals whom they would not choose to marry.

According to the present state of society, one of the influential counteracting elements to marriage is, or ought to be, a high degree of prudence. No one ought to marry who cannot foresee that he will be able to support the additional expenses of a wife and family, and at the same time fulfil his other necessary obligations. By good management, these additional charges are not great, but they amount to something, and he is worse than an infidel who does not provide against them. We are of belief that every industrious, active, and sober man, will find no serious obstacle in this respect. It is from idleness, love of company, and intemperance, not from simple expenditure on family necessaries and comforts, that ruin and poverty in the married life are produced. The dread of encountering the expenses of a family, though acting as a salutary check on imprudent marriages, is frequently productive of many gross vices, tending to the injury both of individuals and of society. Celibacy, especially when circumstances would permit marriage, is not respectable; it is considered akin to vagrancy. He who marries and settles down as a householder, meets with the approbation of the world. Why is this? it may be asked. Because in marrying we give a guarantee to society for our good behaviour. It is not to be doubted that a young, well-educated, industrious couple, who are sincerely and affectionately attached, on a sober examination and conviction of each other's worth and suitability to each other, may be happy with means far short of the fashionable standard. Presuming that such a couple are wise enough to take life for the real and substantial good that it can produce —and as a whole, it would do them great injustice to suppose that they could not find that good in a small, simple, cheerful, tranquil mansion—it would be doing the friends of such a couple the like injustice to suppose that they could not visit them, and be satisfied to see them happy through such means.

According to the usages of society, it is the custom for the man to propose marriage, and for the female to refuse or accept the offer as she may think fit. There ought to be a perfect freedom of the will in both parties. To impose any species of constraint on either party is most mischievous; it would be a gross violation of our most sacred privileges. Both parties, therefore, ought freely to think for themselves, however much they may seek the advice of those who are inclined to afford them counsel.

In treating of this subject, it may be of service to offer a few special advices to young women. Our first recommendation is, that they ought to be in no haste to accept a lover. Let them know him a sufficient time to judge of his qualities of mind, temper, habits, &c., before they allow themselves to be inveigled into a marriage with him. Far better for them to remain single, than heedlessly incur the risk of being miserable during the remainder of their lives. In general, young women are much too anxious to involve themselves in this respect. The following observations on the injurious effects of making marriage the sole object of a young woman's thoughts, occur in a popular work by Mrs Farrar, and are well worth attention.

"Some one has said, that 'matrimony is with women the great business of life, whereas with men it is only an incident'—an important one, to be sure, but only one among many to which their attention is directed, and often kept entirely out of view during several years of their early life. Now, this difference gives the other sex a great advantage over you; and the best way to equalise your lot, and become as wise as they are, is to think as little about it as they do.

The less your mind dwells upon lovers and matrimony, the more agreeable and profitable will be your intercourse with gentlemen. If you regard men as intellectual beings, who have access to certain sources of knowledge of which you are deprived, a derive all the benefit you can from the attainments and experience—if you talk one rational being should with another, remind them that you are candidates for —you will enjoy far more than you can by them under that one aspect of possible futu and lovers. When that is the ruling and thought, you have not the proper use of you your manners are constrained and awkwa easily embarrassed, and made to say what is silly, and out of place; and you defeat your by appearing to a great disadvantage.

However secret you may be in these if you are continually thinking of them, and undue importance to the acquaintance of it will most certainly show itself in your m conversation, and will betray a weakness tha especial contempt by the stronger sex.

Since the customs of society have awar the privilege of making the first advan matrimony, it is the safest and happiest way to leave the matter entirely in his hands. be so educated as to consider that the g existence—preparation for eternity—may attained in married or single life, and tha but the most perfect one is at all desirab mony should be considered as an incident in if it come at all, must come without any of yours; and therefore you may safely p thoughts of it till some one forces the s your notice by professions of a particular you.

Lively, ingenuous, conversable, and cha girls, are often spoiled into dull, bashful, s ladies, and all because their heads are fu about beaux and lovers. They have a thousa and feelings which they would be ashamed though not ashamed to entertain; and the pation with a subject which they had better alone, prevents their being the agreeable a companions of the gentlemen of their a which they were designed to be.

Girls get into all sorts of scrapes by preoccupation of mind; they misconstru monest attentions into marks of particular r thus nourish a fancy for a person who has thought of them but as an agreeable ac They lose the enjoyment of a party, if eve are not there whom they expected to m become jealous of their best friends, if the there, and do not talk to them as much as every trifle is magnified into something of —a fruitful source of misery—and things portance are neglected for chimeras. And gratuitous pains-taking defeats its own ends! is all in vain; such girls are not the most po those who seem never to have thought about at all, are sought and preferred before th may add the advice, that young women consider it a serious misfortune even if nev there is nothing disreputable, while there m happiness, in the condition of an old maid.

...preceding rules, if as closely followed as human ...ction will allow, can hardly fail to secure happiness. And should only one out of every ten readers ...y them, I shall be richly paid for their concoction.

...not conclude this brief essay better than by ...the following admirable advices of Julia de Roubigné ...her daughter, shortly previous to her death:—...etness of temper, affection to a husband, and ...n to his interests, constitute the duties of a wife, ...m the basis of matrimonial felicity. These are, ...the texts from which every rule for attaining ...city is drawn. The charms of beauty, and the ...ey of wit, though they may captivate in the mis...ill not long delight in the wife. They will shorten ...eir own transitory reign, if, as I have seen in ...ives, they shine more for the attraction of every ...e than of their husbands. Let the pleasing of ...a person be a thought never absent from your ...If he love you as you would wish he should, ...d bleed at heart should he suppose it for a moment withdrawn; if he do not, his pride will supply the ...love, and his resentment that of suffering. ...r consider a trifle what may serve to please him ...ater articles of duty he will not discern as his due

but the lesser attentions he will mark as favours; and, trust me, for I have experienced it, there is no feeling more delightful to one's self, than that of turning these little things to so precious a use.

Above all, let a wife beware of communicating to others any want of duty or tenderness she may think she has perceived in her husband. This untwists at once those delicate cords which preserve the unity of the marriage engagement. Its sacredness is broken for ever, if third parties are made witnesses of its failings or umpires of its disputes.'"*

FAMILY RELATIONSHIP.

The marriage state is the foundation of one of the most sacred and important institutions in society—that of a family. A family is a little commonwealth, jointly governed by the parents, but under the more special guardianship and direction of the husband and father, who is morally and legally the *head of the house*. To the father the children naturally look for protection, subsistence, advice, example, and encouragement. The father, therefore, has a serious obligation to perform in the proper rearing of his children. He is bound to educate them according to his means, to support them till they are able to depend on themselves, and to have them taught a business, or put in some other fair way of gaining an honest livelihood. The children, on the other hand, are bound to obey their parents, and to exert themselves to make them happy.

Parents are sometimes grievously distressed in consequence of the bad behaviour of their children. Their reasonable hopes are disappointed, their best feelings are tortured. An idle, ungrateful, dissolute son, is such a complicated cause of suffering, as may, if any thing may, lead one to murmur at the order of things. It may be admitted that such a parent is very likely to break out with complaints against the world. This suffering, however keen and biting it may be, is not a natural, but a moral evil. There is a moral wrong somewhere. Is it in the parent himself? Has he watched the beginning of error, and drawn his child off from the descending plane? But, perhaps, the downward course has been long begun upon, and art and deceit have made such progress that the child has been able to elude parental inquiry. This can hardly happen with a watchful parent while his child is under his own roof. Perhaps the downward course has been begun upon when a child is at a distant school, college, or in a place of business, preparing for manhood. If a parent has placed a child where he cannot superintend him, or with those who do not undertake to do this, or who will not if they do, the parent is not excused because others are in fault. A child who is sent away from home, is, as the world now is, always sent into some hazard. The hazard is, when least, that the preceptor, guardian, and master may be deceived. The seductions may be such as to plunge a boy into ruin, even before those who see him daily, and who mean to do their duty, have the least intimation of it.

Evils, such as are here alluded to, may be in some measure unavoidable in the present imperfect condition of society; still a parent ought to do all in his power to obviate them by implanting good habits in his children. It would be well, for instance, if fathers of families would endeavour to give their sons a taste for such a judicious course of reading as would lead them from the contemplation of vicious objects of pursuit. If they do so, and put them in a right bias, they may depend on them acquiring a great deal more useful knowledge after they leave school than they could possibly have learned there. Nearly all the men who have distinguished themselves in the world are found to have acquired their knowledge through private desultory study after leaving their classes; and many, in their autobiographies, trace their good fortune to the taste for reading given them by their parents.

A family of children usually consists of the t

and the sincerest. To assume a dictatorial aut
over a brother or sister, is to inflict a wound u
love which is not readily forgiven. We have al
noticed the value of civility and politeness betwee
near connexions; and we add, that sincerity and
are nowhere more profitable and necessary. "F
liarity breeds contempt" is a true saying, and is
apt to find an application of its truth not only in
intercourse of brothers and sisters, but in that w
more distant relations. We beg to warn all class
relations who frequently meet together, against
too much familiarity, against using too little reser
against taking liberties with each other. Let
preserve towards one another the most respectful
friendly terms, if they wish to avoid falling into
rences. Let them remember that the quarrels of
tions are almost irreconcilable, and that, even w
forgiven and in a great measure forgotten, they
very disagreeable feelings among all parties.

DUTIES OF MASTERS AND SERVANTS.

From the earliest ages down to the present
there have been different classes of society. As
where explained, this necessarily arises from the
order of society. The well-established and very
right of inheritance, and the ability which some
of society have to acquire, and which others have
the difference of education, and other obvious
necessarily produce these distinctions. Who among
various classes is the most contented and happy,
quite another matter. There must be some to
and some to be served. They are mutually depend
We hear great complaints, sometimes from masters
regard to their servants, and sometimes from serva
with regard to their masters or employers. This
nexion is regarded as one of the miseries of life;
it is not necessarily so. If the connexion
vexation, there must be error somewhere. We
first speak of the duties of masters, in which we
include those of mistresses.

It is the duty of masters to cultivate the esteem
affection of those whom circumstances have
under them. Servants have the same sort of

esteem for their husbands, to make their wills: that is, put in writing a simple expression of their desire that their husbands may inherit the property which belongs to the wife in virtue of their marriage. By an inattention to this easily performed duty, there are many litigations—many widowers ruined.

MISFORTUNES—EVILS.

Evil is a part of the system of things in which we live, and, as such, must be patiently submitted to. Man was intended to be an active creature. One of the grand aims of the Creator in his formation evidently was, that he should never settle down into a sluggish or stagnant state. It would have been easy for the divine power which breathed into him so wonderful a thing as life, to have surrounded him with nothing but blessings, as they are called, so that he would have nothing to do but enjoy himself. But this would not have produced what the Almighty wished, a world in which a rational being was to exercise his faculties, and use his endowments, with a proper regard to a certain end—an account, namely, to be rendered at the close, of what and how he had done. We are here placed between evils which we are to avoid or subdue, and good which we are to aim at and enjoy; and hence, instead of being a set of torpid machines, as we would have been in any thing like a world of perfect happiness, we are in a perpetual state of vigilance and activity, making the fullest use of those mental and bodily properties with which we have been gifted.

If we narrowly inspect the evils or misfortunes with which we are visited, we will find them invariably to be, either of two kinds. Some are the simple result of an occasional or habitual violation of the laws of nature, or an occasional or habitual failure in that vigilance and activity which we are bound to employ for the avoiding of such distresses. These may be called moral evils. The second class are the result of circumstances over which we had no control, and may therefore be called natural evils. Such a division, however, is only necessary in the present state of our attainments as a race; for there can be no doubt that means were intended to be discovered by the ingenuity of man, for the avoidance and neutralisation of all evils whatever; and, therefore, in the case of what we call

nothing more easy than to form hasty opinions,
but it is very difficult to form a correct

prophet. *We*, by our superior intelligence and reading, know that Mahomet was a vile impostor. The people who lived in our own country a hundred years ago were of belief that certain old women, whom they termed witches, could, by supernatural powers, raise tempests at sea and land, and malevolently interrupt the course of human affairs. The people who possessed this belief were perfectly conscientious in their opinion; yet *we* know that this opinion was a gross absurdity. *We* know that our ancestors believed in an impossibility. Opinion is therefore, as we see, a thing of time and place. The opinion that is supposed to be right in one century, is wrong in the next. What is considered to be a right opinion in Asia, is thought wrong in Europe. What is deemed a correct and praiseworthy belief in Britain, is reckoned an absurdity in France. Indeed, it is often seen that the opinion which is held good in one district of a country, is looked upon with contempt in other districts—so that the whole world is found to be covered, as it were, with a variety of opinions and shades of opinions, like the diversified colours by which countries are depicted in a map. Opinion, we have said, is also dependent on temperament of the body. This is a melancholy truth. A fat and choleric man does not think in exactly the same way as a lean man. A man who enjoys all the comforts which opulence can purchase, has a tendency to think differently in some things from a man who is suffering under misfortunes or poverty. So strangely constituted is the principle which governs opinion, that most men have reason to alter their opinions on many points in their progress through life. They form an opinion in youth, from which in manhood they depart, and form another; and this other they modify into something else as old age comes upon them.

What does all this wonderful contrariety of opinion teach us? Since we see that opinion is dependent on the locality of our birth, on the age in which we live, on the condition in which we may chance to be placed, and on the physical qualities of our bodies, have we therefore no power over opinion? Must we be its slave? These are questions of a solemn character, and

By being confined limited bounds, the national institutions ved, security and prosperity promoted, sts of the people advanced. We freat the people of one nation live at enmity another nation. We find many at open neighbours—that is, they are resorting ical force to settle a dispute. These are be deplored. Nations have mutual wants, al intercourse and trade will obviate. nilar interests at stake. Their inhabibelong to the great human family, and peace with each other. But ambition, l passions—strife, malice, and uncharicontinually in operation to retard their towards a universal philanthropy. Nahe heaviest curse which afflicts humanity. rmous debts and taxations, and in reality ng of all kinds of distresses among the the people have been frequently very war. We say *have been*, for we hope nent will in future be otherwise regulated. We ought to impress upon our minds a surpassing horror of war. Let us think of it as the scourge of the human race, and as one more destructive, physically and morally, than the most virulent epidemic. Were the inhabitants of countries duly impressed with these feelings, did they reflect upon the blessings which are showered upon nations during a lasting peace, they would henceforth resolve to oppose, by every constitutional means, the commencement of wars by their governments. Besides the actual loss of lives and of property to a nation during war, it is incalculable the injury sustained by society by such an infliction. A war of a few years' duration may retard intellectual improvement for a century. We hold, therefore, that it is the duty of every man to discountenance such a system of folly. He cannot be a lover of his country, he cannot be the friend of moral cultivation, who would countenance such an idiotic process of settling quarrels between intelligent nations. According to a rational view of men's condition in separate nations, war can in no case be reconcilable with social happiness, unless on the obvious principle of self-defence. So long as there remain such masses of ignorance over the earth, so long, we are afraid, force must be employed to preserve the little spots of civilisation from the flood of barbarism which might overrun them. May it be anticipated, however, that this urgent necessity will not exist much longer! How glorious would be the prospect, if universal peace were permanently established! We should find one nation instructing another in all the arts and sciences of which it was itself master: we should find an honourable spirit of emulation running through the whole; and all shaping their policy so as to promote the most beneficial intercourse in commerce, literature, and refinements. In the present state of things, as far as it can be accomplished, a kind and friendly international communion is a high moral duty. It is our duty to look with an eye of charity on national peculiarities. We have no right to insult the feelings of the people of any nation, however strange their language, their fashions, or their customs may appear to us. We have likewise no right to taunt them with any apparently improper characteristics in their forms of government. It is our duty to consider them as entitled to live and act according to their own fancy, as independent responsible beings. To write, print, and disseminate any scurrilous jests tending to lower them in general estimation, is not only immoral, but inconsistent with the principles of honour, which do not permit any one to be struck who cannot defend himself. When we therefore insult a foreign nation by our obloquy, we commit the mean and cowardly action of injuring a party which has no means of redressing the grievance.

RECREATIONS AND AMUSEMENTS.

We have often had occasion to show, that this state of being is one of alternate action and repose. There must be serious action, and there must be amusements. It was intended that mortals should be pleased and happy, if they deserve to be so. Those who maintain that life is to be an uninterrupted scene of labour and gravity, are, we hope and believe, entirely mistaken. We discern nothing in the natural world, nor in man's peculiar constitution or relations, which gives the least countenance to such an opinion. Amusement, like every thing else in which free agency is concerned, may be innocent and grateful, or improper, pernicious, and introductory of the worst of evils. Young persons must have the former, or they will seek out the latter. It is the duty and the interest of parents to lead children to take pleasure in such things as can be approved of, and to divert children from such as must be injurious to them, and afflictive to those who are deeply interested in them. We apprehend that there may be persons, and classes of persons, who will disagree with us on this subject, as they may have done on some which have been already touched upon. We should deeply regret to displease any one; but on a matter so impor-

but is trying to get rid of himself, and of time. The most captivating sports are those which are contingent; that is, sports or occupations wherein the result may be highly favourable or otherwise. No one engages in them without expecting to come out on the successful side. Hence, hunting, fishing, horse-racing, and gaming, are of this order. The hope of success is a very high excitement, but the mortification and distress of failure ever far exceed the pleasures of success. There is a tendency to discourage out-of-door sports. This is certainly wrong. If not carried to excess, they are among the most salutary and pleasing amusements in fine weather.

Every one admits that the mind and moral faculties are to be developed, and strengthened, and made to do the best, by exercise. This is equally true of physical power. Every action which it can be proper to do at all, ought to be done in the best way, otherwise we do not answer the end of our being. In the vegetable and animal departments, all proper care and cultivation tend to use and beauty. Is there any reason why the physical powers of man should not have care and cultivation to the same ends? Those who prefer a stooping, lounging, awkward, graceless figure and motion, may be on one side of the question; those who think that it was intended that man should be an upright, easy, frank, comely, and convenient being to himself, and pleasant to all within whose observation he may come, will be on the other.

Although the frame of man is so made as to permit him to assume an endless variety of positions, and to apply his strength in all of them, he does, or should, return always to an upright position. No essential deviation from this position can possibly be a natural one, but for a temporary purpose. This is proved by the framing of the human bones. This framing shows, that, when one walks, it was intended that he should be perpendicular; if he walk in an inclined position, he has not only to move himself, but to resist the power of gravitation at the same time. The muscles, in such case, have a strained and unnatural duty to perform. It seems to have been intended, by the same sort of proof, that human beings should walk with the lower limbs, that is, from the hips downward, and not with an

this gracious gift should be used, and (it as one mode of praise and thanksgiving innocent pleasure. Music is action; it some end; the end is innocent and de enjoyment has the double advantage of and social. Music may be made to prod high moral feeling, and it may be made feeling of very opposite character. Th must be applied to this subject as to al every thing was created, and for some purpose; and that every thing must act to some useful end, if human ignorance o interfere. We therefore contend that make music is to be cultivated, and its thankfully enjoyed.

It is consistent that man, as he is so other animals, should be alike superior and enjoying of musical sounds. He u so. His voice (it would be more proper t voice) includes all the sweet sounds whic by all other animals. He has, by cultivati by applying the atmosphere through the and by delicacy of touch, and by bringi in contact with each other, and by send through that wonderful work of his ow organ, found the means of rendering tribu High, and of softening and purifying hi No doubt, music was given to mortals for ment, and that it is their duty to take it and be thankful for it.

Games.—Games at cards are a very co ment. They may be innocent, but there is commend them. They give no action to th are a very humble occupation for an int Whether the chances in distributing fifty spotted pasteboard fifty successive time four hours, shall possess some of the eng tunate pieces, and others with unfortun hardly be said to be doing ahy thing to a When the sport is over, the thing proved is, that in this use of four hours of a short li so much, and B so much. RELIGIOUS OBLIGATIONS.

ion signifies a system of faith and worship. Reli-
ces from man's perception of his relation to the
of being of which he is a necessary part. The
e and influence of religion is to be felt and
ted throughout the duration of human life, in
is thought and done, with a view to a happier
e perfect state of existence after death. Just
ions of the character and attributes of the Deity
he utmost importance, especially to the young,
inds require to be led aright in all that pertains
reat truths of religion. The religion professed
country is Christianity—the most cheering, the
ble of all faiths. The books to which we point
ruction in the religion of Christ are those of the
New Testament. To them the instructors of
ng will direct the religious studies of those under
arge, as may best seem fit. Besides inculcating
a obligations, these works furnish us with the
rfect system of moral duty ever promulgated.
n of the earliest delivered moral law is compre-
in the Ten Commandments, which are as fol-
1. Thou shalt have no other gods before me.—
shalt not make unto thee any graven image,
likeness of any thing that is in heaven above,
is in the earth beneath, or that is in the water
he earth: Thou shalt not bow down thyself to
nor serve them: for I the Lord thy God am a
God, visiting the iniquity of the fathers upon
dren unto the third and fourth generation of
hat hate me, and showing mercy unto thou-
f them that love me, and keep my command-
—3. Thou shalt not take the name of the Lord
d in vain; for the Lord will not hold him
s that taketh his name in vain.—4. Remember
bath-day, to keep it holy. Six days shalt thou
and do all thy work: But the seventh day is
bath of the Lord thy God; in it thou shalt not
work, thou, nor thy son, nor thy daughter, thy
rvant, nor thy maid-servant, nor thy cattle, nor
anger that is within thy gates: For in six days
ade heaven and earth, the sea, and all that
is, and rested the seventh day: wherefore the
lessed the Sabbath-day, and hallowed it.—[By
ctice of Christians, the Sabbath has been trans-
to the first day of the week.]—5. Honour thy
and thy mother, that thy days may be long upon
d which the Lord thy God giveth thee.—6. Thou

shalt not kill.—7. Thou shalt not commit adultery.—8. Thou shalt not steal.—9. Thou shalt not bear false witness against thy neighbour.—10. Thou shalt not covet thy neighbour's house, thou shalt not covet thy neighbour's wife, nor his man-servant, nor his maid-servant, nor his ox, nor his ass, nor any thing that is thy neighbour's."

Such was the sum of the moral law, until Christ added to it a number of the most transcendently excellent admonitions, and which are found scattered throughout the history of his ministrations in the four gospels in the New Testament. The chief moral which he inculcated was, "Whatsoever ye would that men should do unto you, even so do unto them; for this is the law and the prophets." But the whole of his sayings breathe a similar spirit of benevolence and gentleness. He preached, for the first time that it had been done on earth, the doctrine of "peace and good-will towards men;" that is, universal love and peace among all mankind. "Ye have heard," said he, "that it hath been said, Thou shalt love thy neighbour, and hate thine enemy: but I say unto you, Love your enemies: bless them that curse you: do good to them that hate you: and pray for them which despitefully use you and persecute you." Again, he said, "Blessed are the poor in spirit, for theirs is the kingdom of heaven: blessed are they that mourn, for they shall be comforted: blessed are the meek, for they shall inherit the earth: blessed are they which do hunger and thirst after righteousness, for they shall be filled: blessed are the merciful, for they shall obtain mercy: blessed are the pure in heart, for they shall see God: blessed are the peacemakers, for they shall be called the children of God: blessed are they which are persecuted for righteousness' sake, for theirs is the kingdom of heaven: blessed are ye when men shall revile you, and persecute you, and shall say all manner of evil against you falsely for my sake." In this manner he taught the great necessity for being humble and lowly in spirit as the basis of all virtue and social happiness. He likewise inculcated, at different times, the necessity of putting away every thing like ostentation in doing good actions. He tells us not to give our alms before men, but to bestow them in secret; not to pray ostentatiously in public, but in a private place. No one, until he appeared, ever pointed out that there was no difference betwixt actual transgression and the wish to transgress. He tells us that sins of the heart are equally punishable with the commission of an offence. He likewise taught that men "cannot serve two masters," that is, do evil actions, however apparently trivial, and at the same time be good men. To break "the least of the commandments" is to be reckoned equivalent to breaking the whole; and it is further said, it is impossible that our oblations to God can be accepted of so long as we live at enmity with a brother; that is, having a quarrel with any one. "Leave thine offering before the altar, and go thy way; first be reconciled to thy brother, and then come and offer thy gift. Agree with thine adversary quickly, whilst thou art in the way with him." Who among us, may we ask, keeps this saying in remembrance? Do all who attend the public worship of God hold it in mind?

Again, he says that we are equally to avoid hypocrisy, or a pretence of self-righteousness and ability to show our neighbours their faults, before we have put away the same or other faults from ourselves. "Hypocrite, first cast the beam out of thine own eye, and then thou shalt see clearly to cast out the mote out of thy brother's eye. Judge not, that ye be not judged." How valuable are these reproofs! Continuing to admonish us of the danger of hypocrisy, he says that we shall know men by their fruits; that is, we shall know them by their actions, not their words. "A good tree cannot bring forth evil fruit, neither can a corrupt tree bring forth good fruit: therefore by their fruits ye shall know them. Not every one that sayeth unto me, Lord, Lord, shall enter into the kingdom of heaven; but he that doeth the will of my Father which is in heaven." We are likewise told that there must be no stop to the exercise of our forgiving of injuries. Being asked if we should forgive an injury for seven times, he said to those who asked him, "I say not unto thee, until seven times, but until seventy times seven;" by which we are to understand that there is to be no limit to our forgiveness. Of all things, we are told by St Paul, are essential Faith, Hope, and Charity, but that the greatest of these is Charity, or a disposition to think well of our neighbours whatever may be their actions. It is also frequently inculcated that charity is the first of the Christian virtues. Personifying it, it is said, "Charity suffereth long, and is kind; charity envieth not; charity vaunteth not itself, is not puffed up, doth not behave itself unseemly, seeketh not her own, is not easily provoked, thinketh no evil; rejoiceth not in iniquity, but rejoiceth in the truth; beareth all things, believeth all things, hopeth all things, endureth all things."

CONCLUSION.

We have now given an elucidation of what we consider to be the principal duties we are called on to perform during life, both to ourselves and to others. The subject is by no means exhausted, yet enough has been said to afford human beings a view of what they ought to follow in the pursuit of individual and social happiness. The object we held in view has been accomplished. We have, to the best of our ability, pointed out how rich and old, high and low, rich and poor, is to act in executing their temporal duties. We hope we have shown that if man be not a happy, a grateful, a gratified being, he must accuse himself, and not the Deity, or that the system of being to which he belongs is unkind and malevolent. We have attempted to prove that man, individually and socially, is capable of improvement; that he has removed himself from his original condition, and has advanced far in disclosing his powers, and in applying them in the promotion of his own happiness. But it has to be added, that there is still much farther to go in the same course, and that no way is known to him, and that there are no obstacles in it which he may not remove. We do not believe in the perfectibility of mankind. The crimes and miseries which affect even the most cultivated of our race tell us too plainly that there is a natural bias towards evil which it requires the utmost skill on the part of religion and reason to counteract. The passions exist only to stand as a barrier against human perfection. It is only by their due regulation that we can attain as much as comparative worldly happiness. What incalculable to what extent the exaltation of the faculties may be carried by systems of education, or to what extent the community may be purified of vices. Let us hope that nothing may occur to impede the physical, the intellectual, and moral improvement of society, which is now so happily in the way of improvement.

NOTE.—The former article was an abstract from the Class-Book of Mr William Sullivan, a work published in the United States. The present is partly original, selected from the same production. Excellent as Mr book is, it is singularly deficient in the inculcation of principal public duties of life, and is in many parts ad for the perusal of American readers. The heads in article, Duties as Subjects, as Electors, as Jurors, as Servants, Conduct at Public Meetings, Making a Will tures and Evils, Inequality of Rank, Duties which the one Country owe to those of another, Duty of Trusting to Religious Obligations, and Conclusion, are the compos of the Editors, as also a number of passages in other is humbly trusted that both numbers will be found t most complete as well as the most applicable body of on the moral duties ever given to the public; and that teachers of youth will find it available in their purpose lectual cultivation.

LIFE AND MAXIMS OF FRANKLIN.

PARENTAGE AND BOYHOOD.

...AMIN FRANKLIN was born at Boston, in New Eng-..., North America, on the 17th January 1706, and ... the youngest but two of a family of seventeen chil-..., two daughters being born after him. His ances-..., as far as they can be traced back (at least three ...dred years), were petty freeholders at Eaton, in ...hamptonshire; but if we may judge by the sur-...e of the family—the ancient Norman appellative ...a country gentleman—we may conclude they had ...nally been of some consequence. After the Refor-...ion, the immediate progenitors of Benjamin con-...ed zealously attached to the Church of England till ...rds the close of the reign of Charles the Second, ...n his father Josias, along with his uncle Benjamin, ...me dissenters. These men were both bred to the ...e of silk-dyeing. Josias married early in life; and ...t the year 1682 he emigrated, with his wife and ...e children, to America, on account of the persecu-...n to which he was exposed for his dissenting prin-...es. On arriving in New England, he embraced the ...upations of soap-boiler and tallow-chandler, of which ...nesses he previously knew nothing, but only from ...e being at the time the likeliest to provide mainte-...ce for his increasing family. He appears to have ...n a man of great penetration and solid judgment; ...ent, active, and frugal; and although kept in con-...tive poverty by the expenses of his numerous family, was held in great esteem by his townsmen. In no respect was his practical good sense more conspicuous than in the education of his children; and his illustrious son frequently alludes, in terms of thankfulness and gratitude, to the many exemplary precepts and sound moral lessons he received while under the paternal roof. The following passage may be read with no little instruction by the heads and members of all families similarly circumstanced:—"He was fond of having at his table, as often as possible, some friends, or well-informed neighbours, capable of rational conversation; and he was always careful to introduce useful or ingenious topics of discourse, which might tend to form the minds of his children. By this means, he early attracted our attention to what was just, prudent, and beneficial in the conduct of life. He never talked of the meats which appeared on the table; never discussed whether they were well or ill dressed, of a good or bad flavour, high-seasoned or otherwise, preferable or inferior to this or that dish of a similar kind. Thus accustomed from my infancy to the utmost inattention to these objects, I have since been perfectly regardless of what kind of food was before me; and I pay so little attention to it even now, that it would be a hard matter for me to recollect, a few hours after I had dined, of what my dinner had consisted. When travelling, I have particularly experienced the benefit of this habit; for it has often happened to me to be in company with persons, who, having a more delicate because a more exercised taste, have suffered in many cases considerable inconvenience; while, as to myself, I have had nothing to desire." Benjamin was at first designed to be a clergyman, and at eight years of age was put to the grammar-school with that view, having previously been taught to read. His uncle Benjamin, who had likewise emigrated, encouraged this project. This individual appears to have been an equally eccentric and ingenious man. He cultivated the Muses with a success that gave himself, at least, entire satisfaction. But what he was most proud of was a species of short-hand of his own invention, wherewith he had carried off from the conventicles in England several volumes of sermons whole and entire; and these he designed for his nephew's stock in trade, when he should set up as preacher. But young Franklin had not been a year at school when his father perceived that his circumstances were quite inadequate to the expenses necessary to complete his son's education for the clerical profession. He accordingly removed him from the more learned seminary, and placed him under an humble teacher of reading and writing for another twelvemonth, preparatory to binding him to some handicraft trade.

APPRENTICESHIP.

When his term at school was expired, being then ten years of age, he was taken home to assist his father in

of nine years; that is, until he should reach the age of twenty-one.

The choice of this profession, as it turned out, was a lucky one; and it was made after much careful and correct observation on the part of the parent. He had watched his son's increasing fondness for books, and thirst for information, and that, too, of a solid and instructive sort; and he therefore judiciously resolved to place him in a favourable situation for gratifying this propensity in the youthful mind; while he would, at the same time, be instructed in a profession by which he could always independently maintain himself, in whatever quarter his fortunes might lead him, within the bounds of the civilised world. Franklin thus speaks of his early and insatiable craving after knowledge:—

"From my earliest years I had been passionately fond of reading, and I laid out in books all the money I could procure. I was particularly pleased with accounts of voyages. My first acquisition was Bunyan's collection, in small separate volumes. These I afterwards sold, in order to buy an historical collection by R. Burton, which consisted of small cheap volumes, amounting in all to about forty or fifty. My father's little library was principally made up of books of practical and polemical theology. I read the greatest part of them. There was also among my father's books Plutarch's Lives, in which I read continually, and I still regard as advantageously employed the time devoted to them. I found, besides, a work of De Foe's, entitled An Essay on Projects, from which, perhaps, I derived impressions that have since influenced some of the principal events of my life." It seems to have been lucky for himself and mankind that the last-named author's most celebrated work, Robinson Crusoe, did not fall into his hands at this period.

By his assiduity Franklin soon attained great proficiency in his business, and became very serviceable to his brother. At the same time, he formed acquaintance with various booksellers' apprentices, by whose furtive assistance he was enabled to extend the sphere of his reading. This gratification, however, was for the most part enjoyed at the expense of his natural rest. "How often," says he, "has it happened to me to pass the

of the name of Collins, who was like ately fond of books, and with whom and long arguments on various subject this circumstance, Franklin comment the dangerous consequences of acquiri habit, as tending to generate acrimon society, and often hatred betwixt the He dismisses the subject with the fo enough observation:—"I have since men of sense seldom fall into this err lows of universities, and *persons of educated at Edinburgh*, excepted!" Franklin and his companion having a an argument one day, which was mai sides with equal pertinacity, they parte ing it to a termination; and as they wer for some time, an agreement was made carry on their dispute by letter. This done; when, after the interchange of the whole correspondence happened hands of Franklin's father. After much interest, his natural acuteness enabled him to point out to his son how to his adversary in elegance of expressio and perspicuity. Feeling the justice of marks, he forthwith studied most anxi his style; and the plan he adopted for equally interesting and instructive.

"Amidst these resolves," he says, of the Spectator fell into my hands. lication I had never seen. I bought t read it again and again. I was enc thought the style excellent, and wishe power to imitate it. With this view I the papers, made short summaries of t period, and put them for a few days without looking at the book, endeavour essays to their due form, and to expre at length, as it was in the original, emp appropriate words that occurred to my wards compared my Spectator with t perceived some faults, which I correcte that I chiefly wanted a fund of words.

mes the satisfaction to think, that, in certain ulars of little importance, I had been fortunate h to improve the order of the thought or style; is encouraged me to hope that I should succeed ie in writing decently in the English language, was one of the greatest objects of my ambition."

it was not only by such rigorous self-imposed that this extraordinary man, even at so early an ndeavoured to chasten his mind, and make every l propensity subservient to his sense of duty. so began to exercise those acts of personal self- which the heyday of youth, the season for ani- njoyment, feels as the most intolerable of all ctions. Having met with a work recommending a able diet, he determined to adopt it. Finding, after days' trial, that he was ridiculed by his fellow- ers for his singularity, he proposed to his brother e the half of what was now paid by that relative s board, and therewith to maintain himself. No ion was, of course, made to such an arrangement; ie soon found that of what he received he was to save one-half. "This," says he, "was a new for the purchase of books, and other advantages ed to me from the plan. When my brother and orkmen left the printing-house to go to dinner, nained behind; and dispatching my frugal meal, frequently consisted of a biscuit only, or a slice ead and a bunch of raisins, or a bun from the y-cook's, with a glass of water, I had the rest of me till their return for study; and my progress in was proportioned to that clearness of ideas and ness of conception which are the fruits of tempe- in eating and drinking."

other remarkable instance of the resolute way in he set about making himself master of whatever rement he found more immediately necessary to t the moment, is the following:—Having been put blush one day for his ignorance in the art of cal- on, which he had twice failed to learn while at , he procured a copy of Cocker's Arithmetic, and hrough it all, making himself completely master of re turning his mind to any thing else! He soon also, gained some little acquaintance with geome- y perusing a work on navigation. He mentions, se, his reading about this time Locke's Essay on derstanding, and the Art of Thinking, by Messrs rt Royal. Having found, in some essay on rhe- nd logic, a model of disputation after the manner rates, which consists in drawing on your oppo- by insidious questions, into making admissions militate against himself, he became excessively f it, he says, and practised it for some years with success, but ultimately abandoned it, perceiving could be made as available to the cause of wrong t of right, while the prime end of all argument convince or inform.

ut three years after Franklin went to his appren- p, that is to say, in 1721, his brother began to newspaper, the second that was established in ca, which he called the New England Courant: e previously established was the Boston News . The new publication brought the most of the of Boston about the printing-office, many of were contributors; and Franklin frequently ard them conversing about the various articles ppeared in its columns, and the approbation with particular ones were received. He became am- s to participate in this sort of fame; and having n out a paper, in a disguised hand, he slipped it the door of the printing-office, where it was found morning, and submitted, as usual, to the critics they assembled. "They read it," he says; "com- d on it in my hearing; and I had the exquisite are to find that it met with their approbation; and n the various conjectures they made respecting thor, no one was mentioned who did not enjoy a reputation in the country for talent and genius. supposed myself fortunate in my judges, and to suspect that they were not such excellent writers as I had hitherto supposed them. Be this as it may, encouraged by this little adventure, I wrote and sent to press, in the same way, many other pieces which were equally approved—keeping the secret till my slender stock of information and knowledge for such performances was pretty completely exhausted." He then discovered himself, and had the satisfaction of finding he was treated with much more respect by his brother and his friends than heretofore.

The two brothers, however, lived together on very disagreeable terms, in consequence of the hasty and overbearing temper of the elder; and Benjamin anxiously longed for an opportunity of separating from him. This at last occurred. His brother was apprehended and imprisoned for some political article which offended the local government, and upon his liberation was prohibited from ever printing his newspaper again. It was therefore determined that it should be published in Benjamin's name, who had managed it during his brother's confinement with great spirit and ability. To avoid having it said that the elder brother was only screening himself behind one of his apprentices, Benjamin's indenture was delivered up to him discharged, and private indentures entered into for the remainder of his time. This underhand arrangement was proceeded in for several months, the paper continuing to be printed in Benjamin's name; but his brother having one day again broken out into one of his violent fits of passion, and struck him, he availed himself of his discharged indentures, well knowing that the others would never be produced against him, and gave up his employment. Franklin afterwards regretted his having taken so unfair an advantage of his brother's situation, and regarded it as one of the first *errata* of his life. His brother felt so exasperated on the occasion, that he went round all the printing-houses, and represented Benjamin in such a light that they all refused his services.

PROCEEDS TO PHILADELPHIA.

Finding he could get no employment at Boston, as well as that he was regarded with dislike by the government, he resolved to proceed to New York, the nearest town in which there was a printing-office. To raise sufficient funds for this purpose, he sold part of his library; and having eluded the vigilance of his parents, who were opposed to his intention, he secretly got on board of a vessel, and landed at New York on the third day after sailing.

Thus, at the age of seventeen, Franklin found himself three hundred miles from his native place, from which he was in some sort a runaway, without a friend, or recommendation to any one, and with very little money in his pocket. To complete his dilemma, he found, on applying, that the only printer then in the town could give him no employment. That person, however, recommended him to go to Philadelphia, where he had a son, who, he thought, would give him work; and he accordingly set off for that place. His journey was a most disastrous one both by water and land, and he frequently regretted leaving home so rashly. He reached his destination at last, however, and in a plight which certainly did not bode over-auspiciously for his future fortunes. His own graphic description of his condition and appearance, on his first entrance into Philadelphia, is at once interesting and amusing:—

"I have entered into the particulars of my voyage, and shall in like manner describe my first entrance into this place, that you may be able to compare beginnings so unlikely with the figure I have since made. I was in my working dress, my best clothes being to come by sea. I was covered with dirt; my pockets were filled with shirts and stockings; I was unacquainted with a single soul in the place, and knew not where to seek a lodging. Fatigued with walking, rowing, and having passed the night without sleep, I was extremely hungry, and all my money consisted of a Dutch dollar, and about a shilling's worth of coppers, which I gave to the boatmen for my passage. At first they refused

[illegible] I was [illegible] [illegible] [illegible]

t-paid work: so that, with his frugal mode of living, quickly laid past money.

RETURNS TO AMERICA.

After having been about eighteen months in London, ich to his advantage in every respect—for, besides coming more proficient in his business, he had stuck his books as sedulously as ever, even although he frently went to the play, made little pleasure excurns, and mingled a good deal in society—he was about set out on a tour through Europe, with a young elligent fellow-workman (designing to maintain themves during their pilgrimage by means of their calling), en he accidentally met with Mr Denham, before iced as being his fellow-passenger from America. at gentleman was on the eve of returning to Philaphia, to open a merchant's store, and offered Frankthe situation of his clerk, with a salary of £50 per nnm. This sum was less than he was making as a mpositor; but an anxious desire to revisit his native ntry induced him to accept of it. They set sail accorgly—Franklin now supposing he had relinquished composing-stick for ever—and arrived at Philadelia on the 11th of October 1726. Franklin had just tered his twenty-first year at this time; and he mens having drawn up for himself in writing, during voyage, a plan for the regulation of his future conct. This interesting document was afterwards unrtunately lost; but he tells us himself that he pretty thfully adhered to the rules thus early laid down, en into old age. Upon his arrival, he found that his l acquaintance, the governor, had been supplanted in office, and was held in general contempt. They met veral times, but no allusion was ever made by Franklin the disgraceful imposture the other had practised on n.

Franklin's new employer had only been in business a few months, when both were seized at the same me with a violent disorder, which carried off the ster in a few days, and brought the clerk to the brink the grave. On his recovery, being thus once more t destitute, he was fain to accept employment as a inter from his old master Keimer, who was now somehat better off in the world, but still utterly ignorant his profession. The whole charge of the office, with at of instructing four or five ignorant apprentices, volved on Franklin. "I also," says he, "upon occan, engraved various ornaments, made ink, gave an e to the shop—in short, I was, in every respect, the *totum*." But he likewise, at this time, gave another markable instance of his versatile ingenuity.

"Our press," says he, "was frequently in want of e necessary quantity of letter, and there was no such ade as that of letter-founder in America. I had seen e practice of this art at the house of James, in London, but had at the time paid it very little attention. however, contrived to fabricate a mould. I made use such letters as we had for punches, founded new ters of lead in matrices of clay; and thus supplied, a tolerable manner, the wants that were most pressg." Franklin's inventive mind would seem here to ve obtained a distant glimpse of the principle of *stetyping*, which has since been carried to such a height usefulness and perfection, as exemplified in the varis publications of the editors of this miscellany.

Keimer having engaged Franklin solely with the view having his apprentices so far initiated in the art as at he could dispense with their instructer's services, ok the first occasion to quarrel with him when he ought he had sufficiently attained his object. Upon eir separation, one of Keimer's apprentices, named eredith, who, like all the others, had conceived a eat veneration for Franklin, proposed that they should ter into partnership together—Meredith's friends untaking to furnish the capital necessary for purchasg the materials, &c. This offer was too advantageous be refused, and types, press, &c., were forwarded mmissioned from London; but while preparing to t their plan into execution, Franklin was informed

during the interval, to return again to Keimer, at the urgent solicitation of the latter. The motive for this humble entreaty was that individual's having taken a contract for the printing of some paper-money for the state of New Jersey, requiring a variety of new cuts and types, which he knew well nobody in that place but Franklin could supply. This also presents us with a very striking instance of Franklin's remarkable gift of invention.

"To execute the order," says he, "I constructed a copperplate printing-press—the first that had been seen in the country. I engraved various ornaments and vignettes for the bills, and we repaired to Burlington together, where I executed the whole to the general satisfaction, and he (Keimer) received a sum of money for this work which enabled him to keep his head above water for a considerable time longer."

At Burlington, Franklin formed acquaintance with all the principal personages of the province, who were attracted by his superior abilities and intelligence. Amongst these was the inspector-general, Isaac Decon, "who," says Franklin, "was a shrewd and subtle old man. He told me that his first employment had been that of carrying clay to the brickmakers; that he did not learn to write till he was somewhat advanced in life; that he was afterwards employed as underling to a surveyor, who taught him his trade; and that, by industry, he had at last acquired a competent fortune. 'I foresee,' said he, 'that you will soon supplant this man (speaking of Keimer), and get a fortune in the business at Philadelphia.' He was wholly ignorant at the time of my intention of establishing myself there, or any where else."

ENTERS INTO BUSINESS.

Franklin had scarcely returned from Burlington, when the types commissioned for himself and Meredith, from London, arrived; and having settled matters with Keimer, the partners immediately took a house, and commenced business. They were in the act of opening up their packages, when a countryman came in to have a job done; and as all their cash had been expended in their various purchases, "this countryman's five shillings," says Franklin, "being our first fruits, and coming so seasonably, gave me more pleasure then any crown I have since earned." A number of young men having, during the preceding year, formed themselves, at Franklin's suggestion, into a weekly club for the purpose of mutual improvement, they were so well pleased with the beneficial results they experienced from their meetings, that, when the originator of their society set up in business, every one exerted himself more than another to procure him employment. One of them obtained from the Quakers the printing of forty sheets of a history of that sect, then preparing at the expense of the body. "Upon these," says Franklin, "we worked exceeding hard, for the price was very low. It was in folio, upon *pro patria* paper, and in the *pica* letter, with heavy notes in the smallest type. I composed a sheet a-day, and Meredith put it to press. It was frequently eleven o'clock at night, sometimes later, before I had finished my distribution for the next day's task; for the other little jobs that came in kept us back in this work; but I was so determined to compose a sheet a-day, that one evening, when my form was imposed, and my day's work, as I thought at an end, an accident broke the form, and deranged two complete folio pages. I immediately distributed and composed them anew before I went to bed." This unwearied industry, which soon became known, acquired Franklin great reputation and credit amongst his townsmen, and business began rapidly to flow in upon them.

STARTS A NEWSPAPER.

The establishment and management of a newspaper seems to have all along been a favourite project with Franklin; probably because, from his former experience in it, and the consciousness of his powers of writing, he felt himself so well adapted for the task. The partners soon found themselves in circum[stances] enable them to make the trial; but Franklin incautiously divulged their intention to a third that individual informed their old master Ke the fact, who immediately took steps to anticipa and issued a prospectus of a paper of his ow manner in which Franklin met and defeated this tr is exceedingly characteristic. There was anothe published in Philadelphia by Mr Bradford, wh been in existence for some years, but was such rable affair, that it only preserved its vitality no other arose to knock it on the head. In o keep down Keimer's publication, however, F saw the policy of supporting the old one until p to start his own. He thereupon set about w series of amusing articles for it, which the pu Bradford, was of course very glad to insert. " means," says Franklin, "the attention of the pub kept fixed on that paper, and Keimer's proposals we burlesqued and ridiculed, were disregarde began his paper, however; and, after continuing nine months, having at most not more than nine scribers, he offered it to me for a mere trifle. for some time been prepared for it; I therefo stantly took it upon myself, and in a few years it very profitable to me." In fact, it obtained re and applause at the very first number, in conse of some observations therein by Franklin, on portant colonial question; and various mem Assembly exerted themselves so well in his that the printing of the House was speedily tran from Bradford to his two young rivals. In the m ment of his newspaper, Franklin pursued a sys unflinching integrity. He steadfastly refused t admission into his columns of any article con personal abuse of particular individuals. Wh he was requested to publish any thing of this so answer was, that he would print the piece by itse give the author as many copies for his own distri as he wished. He very wisely considered that h scribers expected him to furnish them with use entertaining information, and not with personal s or private discussions with which they had no co

COMMENCES BUSINESS BY HIMSELF.

Luckily for Franklin, almost at the commence of the newspaper, an opportunity occurred of getti of his partner Meredith, who had become a drunken fellow, and had all along been of compara little use in the concern. Meredith's father fai implement the bargain for advancing the nec capital to pay the demands of the paper-merchan other expenses necessarily attending their speed when they became due. A suit was accordingly tuted against the partners; and as Meredith's declared his inability to pay the amount of the upon them, the son offered to relinquish the whol cern into Franklin's hands, on condition that the would take upon him the debts of the company, his father what he had already advanced, settle h little personal debts, and give him thirty pounds new saddle! By the kindness of two friends, wh known to each other, came forward simultaneous unasked to his assistance, Franklin was enabl accept the offer. The agreement was carried into and thus do we find this extraordinary man, at th of twenty-four, and in the place where he had a penniless only seven years before, settled down in ness, with a thriving trade; proprietor of an exten circulated newspaper, and a firmly established re tion of no ordinary kind. All this success, ha the result of his own good conduct, perseverance frugality, had no undue effect on his well-regu mind, or could induce him to assume those airs of gant superiority and pretension, which have be frequently blemished the character of those who praiseworthily achieved their own elevation in so On the contrary, he dressed more plainly, and dep himself more humbly, than ever; and to show th

above his business, he sometimes wheeled home rrow, with his own hands, the paper which he ed at the stores.

after getting the whole printing and newspaper into his hands, there was an outcry among the for a new emission of paper-money. Franklin the cause, and by his arguments in a pamph- h he published on the subject, contributed so to the success of the proposal, and obtained him- much popularity, that upon its being resolved the notes, Franklin was selected to print them. n opened a stationer's shop, and from his suc- business, began gradually to pay off his debts. hile, his old master Keimer went fast to ruin, th the exception of old Mr Bradford, who was id did not care for business, he was the only in the place. He shortly afterwards married tead, the lady named in a former part of this . Franklin's behaviour to this young lady had n altogether blameless. Previous to his sailing gland, he had exchanged pledges of affection with et, all the while he was away, he only sent her ter. Her friends and herself concluding that he never meant to return, or that he wished to drop ion with her, she was induced to accept the hand her suitor, and on his return to America Frank- nd her married—an event that seems to have im extremely little uneasiness. The lady's hus- proved a great rogue, deserted her, and it was uently ascertained that he had still a former wife

After being established in business, and rising world, the intimacy between Franklin and her was renewed, and it was not long ere, despite abious situation, they hazarded a fulfilment of arly vows. The lady was about Franklin's own nd proved, according to his own testimony, "an r and a blessing" to him.

1731, Franklin drew up proposals for a public iption library at Philadelphia, being the first t of the sort that had been started in America. persons at first subscribed forty shillings each, reed to pay ten shillings annually; and the esta- ent was put under such judicious rules of ma- ent, that in the course of ten years it became nable and important as to induce the proprietors themselves incorporated by royal charter. This r afforded its founder facilities of improvement of he did not fail to avail himself, setting apart, as s us, an hour or two every day for study, which ie only amusement he allowed himself. Several companies were formed in the city in imitation of the whole were finally united in one institution. e for reading was thus spread around, and libra- ere formed throughout Pennsylvania.

nklin was much gratified by the success of his ie, and continued by his example to encourage of industry in the young, and to raise a taste for y and other rational recreations. We now find it the early age of twenty-five or twenty-six, fairly rked in life as a tradesman, citizen, and a lover rary and scientific pursuits. His first considera- vas scrupulous attention to business and to his . He took care, he says, not only to be *really* rious and frugal, but also to avoid every ap- nce to the contrary—was plainly dressed, and ever seen in any place of amusement: never went ing or hunting; his only relaxation being in a at chess, of which he was very fond. He devoted eater part of his leisure time to self-examination nprovement. On instituting a rigorous examina- nto his conduct and character, he found that he sed many faults, which he resolved upon amend- ie even conceived the bold idea of seeking to attain *perfection*. With the view of carrying this pro- nto execution, he fell upon the device of metho- ; his time during the twenty-four hours of every and of laying down certain rules by which he d regulate his conduct and sentiments. He rose n the morning; the next three hours he appropri- ated to devotional exercise, study, cleaning of the person, and breakfast. From 8 till 12 he was at work. From 12 till 2 he read, did any desultory duties, and dined. From 2 till 5 he was again at work. From 6 till 10, he devoted to reading, conversation, intercourse with his family, and supper; and from 10 till 4 or 5 in the morning, to sleep; after which he arose and pursued the same routine as before. We thus see that early rising was a leading feature in his habits of life, and to this alone he doubtless owed much of his success.

Franklin's arrangement of his time was less remark- able than his plan of self-examination. We have said that he established certain rules for the regulation of his conduct. These were thirteen in number, and were called by him virtues or precepts to be kept in remem- brance: they are thus summed up:—Temperance; silence, or abstaining from frivolous talking; order; resolution, or determination to perform promises and duties; frugality; industry; sincerity, or avoiding of all deceit; justice, or the wronging of no one; modera- tion; cleanliness; tranquillity of mind; chastity; and humility, in which was included an endeavour to imi- tate Christ, and also Socrates. It is mentioned by Franklin, that it required a constant care to avoid in- fringing upon these precepts, and that at length, to assist himself, he prepared a book to serve as a journal of his conduct and thoughts, in which he took pains to mark every error he committed. By this means he was able to observe how he advanced in virtue, and how far he abstained from error: it was his anxious wish to see the tables in his book free from any markings or indi- cations of imperfection of character. To this journal of his conduct he attached certain mottoes; one of which was a verse from the Proverbs of Solomon, in which wisdom is eulogised:—"Length of days is in her right hand, and in her left riches and honour. Her ways are ways of pleasantness, and all her paths are peace." Another of his mottoes was in the form of a pious aspiration or prayer, in which he implored the divine blessing on his labours, and an increase of that wisdom which was most beneficial to him. One of his favourite passages, which he occasionally repeated, was the beautiful address to the Deity in Thomson's poem on the Seasons:—

> "Father of light and life, thou God supreme!
> Oh teach me what is good; teach me thyself!
> Save me from folly, vanity, and vice,
> From every low pursuit; fill my soul
> With knowledge, conscious peace, and virtue pure,
> Sacred, substantial, never-fading bliss!"

He tells us that the most troublesome part of his prescribed task of self-regulation, was the obligation to preserve order in his line of duties—being most likely liable to distraction by trifling circumstances constantly interfering to mar his project. Neverthe- less, he persevered, forced himself to be methodic, and was thus able to proceed with studies tending greatly to his mental improvement, and his increase in useful knowledge.

Of Franklin's intercourse with his family little has been made known, though it is ascertained, by a few scattered hints in his writings, that he was an affection- ate husband and father, and placed much of his happi- ness in home. In his household affairs the most exact economy prevailed, and, for several years after his mar- riage, his breakfast consisted simply of bread and milk, which he ate from a twopenny earthenware porringer, with a pewter spoon. Fortunately, his wife was as much disposed to be industrious as he was; she assisted him in his business, folded the sheets of books which he printed, kept his shop, and executed other humble but useful duties. By following this industrious and eco- nomical plan of living, they gradually accumulated wealth, and were enabled to possess comforts and luxu- ries which were at first beyond their reach. Still, Franklin was not puffed up by prosperity, but continued to live in a style of simplicity agreeable to the notions he had formed at the outset of his career.

In conducting his business, he happily united the oc-

cupation of a printer with the profession of an author, and thus became the publisher of his own literary productions. No large work, however, was given by him to the world. His writings were chiefly of a minor character, such as detached pamphlets on subjects of local import, and short essays; and he did not, as it appears, write much that has been thought worthy of republication in a succeeding age. His newspaper was the Pennsylvania Gazette, which had been started by Keimer in 1728, and which, after about a twelvemonth's mismanagement, had come into the possession of Franklin and Hugh Meredith. By Franklin's ingenuity, the paper rose in general estimation.

Besides editing his newspaper, he conducted and published an almanack, which he began in 1732, and continued for a period of twenty-five years. This almanack bore the feigned name, Richard Saunders, and hence acquired the title of Poor Richard's Almanack, by which it became extensively known. The leading feature of the work consisted in an array of concise maxims and apothegms of an economical character, distributed here and there throughout the calendar, wherever space was left betwixt the names of the holidays. When Poor Richard's Almanack was brought to a close, a considerable number of the maxims were collected in an Address to the Reader, in the last number, and entitled The Way to Wealth. This admirable digest has been since translated into various languages, and is now widely known. We here subjoin a copy:—

THE WAY TO WEALTH.

I stopped my horse lately where a great number of people were collected at an auction of merchants' goods. The hour of sale not being come, they were conversing on the badness of the times; and one of the company called to a plain, clean old man, with white locks, "Pray, Father Abraham, what think ye of the times? Won't these heavy taxes quite ruin the country? How shall we ever be able to pay them? What would you advise us to?" Father Abraham stood up, and replied, "If you have my advice, I'll give it to you in short: 'for a word to the wise is enough: and many words won't fill a bushel,' as poor Richard says." They joined in desiring him to speak his mind; and, gathering round him, he proceeded as follows:—

"Friends (says he) and neighbours, the taxes are indeed very heavy; and if those laid on by the government were the only ones we had to pay, we might more easily discharge them: but we have many others, and much more grievous to some of us. We are taxed twice as much by our idleness, three times as much by our pride, and four times as much by our folly; and from these taxes the commissioners cannot ease or deliver us, by allowing an abatement. However, let us hearken to good advice, and something may be done for us: 'God helps them that help themselves,' as poor Richard says in his Almanack.

It would be thought a hard government that should tax its people one-tenth part of their time, to be employed in its service; but idleness taxes many of us much more, if we reckon all that is spent in absolute sloth, or doing of nothing, with that which is spent in idle employments, or amusements that amount to nothing. Sloth, by bringing on diseases, absolutely shortens life. 'Sloth, like rust, consumes faster than labour wears; while the key often used is always bright,' as poor Richard says. 'But dost thou love life? then do not squander time, for that's the stuff life is made of,' as poor Richard says. How much more than is necessary do we spend in sleep! forgetting that 'the sleeping fox catches no poultry, and that there will be sleeping enough in the grave,' as poor Richard says. 'If time be of all things the most precious, wasting time must be (as poor Richard says) the greatest prodigality, since, as he elsewhere tells us, 'Lost time is never found again; and what we call time enough, always proves little enough.' Let us then up and be *doing* to the purpose: so by diligence shall we do more with less perplexity. 'Sloth makes all things difficult, but industry all easy,' as poor Richard says; and 'He that riseth late must trot all day, and shall scarce overtake his business at night; while diligence comes leisurely and looks fresh; for laziness travels so slowly, that poverty soon overtakes him,' as we read in poor Richard; who adds, 'Drive thy business, let not that drive thee;' and,

> 'Early to bed, and early to rise,
> Makes a man healthy, wealthy, and wise.'

So what signifies wishing and hoping for better times? We make these times better if we better ourselves. 'Industry needs not wish,' as poor Richard says, 'and he that lives upon hope will die fasting.' 'There are no gains without pains; then help, hands, for I have no lands: or if I have, they are smartly taxed;' and, as poor Richard likewise observes) 'He that hath a trade hath an estate, and he that hath a calling hath an office of profit and honour;' but then the trade must be followed at, and the calling well followed, or neither the estate nor the office will enable us to pay our taxes. If we are industrious, we shall never starve; for as poor Richard says, 'At the working-man's house hunger looks in, but dares not enter.' Nor will the bailiff nor the constable enter; for 'Industry pays debts, while despair increaseth them,' says poor Richard. What though you have found no treasure, nor has any rich relation left you a legacy? 'Diligence is the mother of good luck,' as poor Richard says: and 'God gives all things to industry: then plough deep while sluggards sleep, and you will have corn to sell and to keep,' says poor Dick. Work while it is called to-day; for you know not how much you may be hindered to-morrow, which makes poor Richard say, 'One to-day is worth two to-morrows;' and, further, 'Have you something to do to-morrow, do it to-day.' 'If you were a servant, would you not be ashamed that a good master should catch you idle? Are you, then, your own master? be ashamed to catch yourself idle,' as poor Dick says. When there is so much to be done for yourself, your family, and your gracious king, be up by peep of day. 'Let not the sun look down, and say, Inglorious here he lies!' Handle your tools without mittens; remember that 'The cat in gloves catches no mice,' as poor Richard says. It is true, there is much to be done, and perhaps you are weak-handed; but stick to it steadily, and you will see great effects; for continual dropping wears away stones, and by diligence and patience the mouse ate into the cable; and 'light strokes fell great oaks,' as poor Richard says in his Almanack, the year I not just now remember.

Methinks I hear some of you say, 'Must a man afford himself no leisure?'—I will tell thee, my friend, what poor Richard says. 'Employ thy time well, if thou meanest to gain leisure; and since thou art not sure of a minute, throw not away an hour.' Leisure is sweet for doing something useful; this leisure the diligent man will obtain, but the lazy man never; so that, as poor Richard says, 'A life of leisure and a life of laziness are two things.' Do you imagine that sloth will afford you more comfort than labour? No; for, as poor Richard says, 'Troubles spring from idleness, and grievous toils from needless ease: many without would live by their own wits only; but they break for want of stock.' Whereas industry gives comfort, plenty, and respect. 'Fly pleasures, and they'll follow you; the diligent spinner has a large shift; and now I have a sheep and a cow, every body bids me good morrow:' all which is well said by poor Richard.

But with our industry, we must likewise be steady, and settled, and careful, and oversee our own affairs with our own eyes, and not trust too much to others, for, as poor Richard says,

> 'I never saw an oft-removed tree,
> Nor yet an oft-removed family,
> That throve so well as one that settled be.'

And again, 'Three removes are as bad as a fire;' and again, 'Keep thy shop, and thy shop will keep thee;' and again, 'If you would have your business done, go; if not, send.' And again,

'He that by the plough would thrive,
Himself must either hold or drive.'

, 'The eye of the master will do more work
his hands:' and again, 'Want of care does
mage than want of knowledge:' and again,
ersee workmen is to leave them your purse
usting too much to others' care is the ruin
for, as the Almanac says, 'In the affairs of
men are saved not by faith, but by the want
a man's own care is profitable; for,' saith
, 'Learning is to the studious, and riches to
l, as well as power to the bold, and heaven to
is.' And, further, 'If you would have a faith-
t, and one that you like, serve yourself.' And
adviseth to circumspection and care, even in
st matters, because sometimes 'A little neglect
l great mischief;' adding, 'For want of a nail
as lost; for want of a shoe the horse was lost;
nt of a horse the rider was lost:' being over-
slain by the enemy, all for want of care about
oe nail.

h for industry, my friends, and attention to
business; but to these we must add frugality,
ld make our industry more certainly success-
an may, if he knows not how to save as he
p his nose all his life to the grindstone, and
rth a groat at last.' 'A fat kitchen makes a

r estates are spent in the getting;
women for tea forsook spinning and knitting,
men for punch forsook hewing and splitting.'

would be wealthy (says he in another Alma-
k of saving, as well as of getting: the Indies
made Spain rich, because her outgoes are
an her incomes.'

hen, with your expensive follies, and you will
nuch cause to complain of hard times, heavy
chargeable families; for, as poor Dick says,

omen and wine, game and deceit,
ake the wealth small, and the want great.'

her, 'What maintains one vice would bring
ildren.' You may think, perhaps, that a little
little punch now and then, diet a little more
nthes a little finer, and a little entertainment
then, can be no great matter; but remember
Richard says—'Many a little makes a mickle:'
er, 'Beware of little expenses; a small leak
a great ship:' and again, 'Who dainties love
ars prove:' and moreover, 'Fools make feasts,
men eat them.'

ou are all got together at this sale of fineries
nacks. You call them *goods*; but if you do not
, they will prove *evils* to some of you. You
ey will be sold cheap, and perhaps they may
an they cost; but if you have no occasion for
y must be dear to you. Remember what poor
ays—'Buy what thou hast no need of, and ere
shalt sell thy necessaries.' And again, 'At
nnyworth pause a while.' He means, that per-
cheapness is apparently only, or not real, or
in, by straitening thee in thy business, may do
e harm than good. For in another place he
any have been ruined by buying good penny-

Again, as poor Richard says, 'It is foolish
money in a purchase of repentance;' and yet
is practised every day at auctions, for want
ng the Almanac. 'Wise men (as poor Dick
rn by others' harms, fools scarcely by their
t *Felix quem faciunt aliena pericula cautum.*'
ople, for the sake of finery on the back, have
a hungry belly, and half starved their fami-
k and satins, scarlet and velvets (as poor Rich-
), put out the kitchen fire.' These are not the
es of life; they can scarcely be called the con-
s; and yet, only because they look pretty, how
nt to have them! The artificial wants of man-
s become more numerous than the natural;
poor Dick says, 'For one poor person there
are a hundred indigent.' By these and other extravagances, the genteel are reduced to poverty, and forced to borrow of those whom they formerly despised, but who, through industry and frugality, have maintained their standing; in which case it appears plainly, 'A ploughman on his legs is higher than a gentleman on his knees,' as poor Richard says. Perhaps they have had a small estate left them which they knew not the getting of; they think 'It is day, and will never be night; that a little to be spent out of so much is not worth minding.' 'A child and a fool (as poor Richard says) imagine twenty shillings and twenty years can never be spent; but always taking out of the meal-tub, and never putting in, soon comes to the bottom:' then, as poor Dick says, 'When the well is dry, they know the worth of water.' But this they might have known before, if they had taken his advice: 'if you would know the value of money, go and try to borrow some; for he that goes a-borrowing goes a-sorrowing, and, indeed, so does he that lends to such people when he goes to get it in again.' Poor Dick further advises, and says,

'Fond pride of dress is sure a very curse:
Ere fancy you consult, consult your purse.'

And again, 'Pride is as loud a beggar as Want, and a great deal more saucy.' When you have bought one fine thing, you must buy ten more, that your appearance may be all of a piece; but poor Dick says, 'It is easier to suppress the first desire than to satisfy all that follow it.' And it is as truly folly for the poor to ape the rich, as the frog to swell in order to equal the ox.

'Vessels large may venture more,
But little boats should keep near shore.'

'Tis, however, a folly soon punished; for 'Pride that dines on vanity sups on contempt,' as poor Richard says. And in another place, 'Pride breakfasted with Plenty, dined with Poverty, and supped with Infamy.' And, after all, of what use is this pride of appearance, for which so much is risked, so much is suffered? It cannot promote health, or ease pain; it makes no increase of merit in the person; it hastens misfortune.

'What is a butterfly? At best
He's but a caterpillar drest;
The gaudy fop's his picture just,'

as poor Richard says.

But what madness must it be to run in debt for these superfluities! We are offered, by the terms of this sale, six months' credit, and that perhaps has induced some of us to attend it, because we cannot spare the ready money, and hope now to be fine without it. But, ah! think what you do when you run in debt. You give to another power over your liberty. If you cannot pay at the time, you will be ashamed to see your creditor; you will be in fear when you speak to him: you will make poor, pitiful, sneaking excuses, and by degrees come to lose your veracity, and sink into base downright lying; for, as poor Richard says, 'The second vice is lying; the first is running in debt.' And again, to the same purpose, 'Lying rides upon debt's back;' whereas, a freeborn Englishman ought not to be ashamed nor afraid to speak to any man living. But poverty often deprives a man of all spirit and virtue. 'It is hard for an empty bag to stand upright,' as poor Richard truly says. What would you think of that prince, or that government, who would issue an edict, forbidding you to dress like a gentleman or gentlewoman, on pain of imprisonment or servitude? Would you not say that you were free, have a right to dress as you please, and that such an edict would be a breach of your privileges, and such a government tyrannical? And yet you are about to put yourself under that tyranny when you run in debt for such dress! Your creditor has authority at his pleasure to deprive you of your liberty, by confining you in jail for life, or by selling you for a servant, if you should not be able to pay him. When you have got your bargain, you may perhaps think little of payment; but 'Creditors (poor Richard tells us) have better memories than debtors;' and in another place he says,

'Creditors are a superstitious sect, great observers of set days and times.' The day comes round before you are aware, and the demand is made before you are prepared to satisfy it; or if you bear your debt in mind, the term which at first seemed so long, will, as it lessens, appear extremely short. Time will seem to have added wings to his heels as well as at his shoulders. 'Those have a short Lent (saith poor Richard) who owe money to be paid at Easter.' Then since, as he says, 'The borrower is a slave to the lender, and the debtor to the creditor,' disdain the chain, preserve your freedom, and maintain your independence: be industrious and free; be frugal and free. At present, perhaps, you may think yourselves in thriving circumstances, and that you can bear a little extravagance without injury; but

> 'For age and want save while you may,
> No morning sun lasts a whole day,'

as poor Richard says. Gain may be temporary and uncertain; but ever, while you live, expense is constant and certain; and 'It is easier to build two chimneys, than to keep one in fuel,' as poor Richard says. So 'Rather go to bed supperless than rise in debt.'

> 'Get what you can, and what you get hold;
> 'Tis the stone that will turn all your lead into gold,'

as poor Richard says. And when you have got the philosopher's stone, surely you will no longer complain of bad times, or the difficulty of paying taxes.

This doctrine, my friends, is reason and wisdom; but, after all, do not depend too much upon your own industry, and frugality, and prudence, though excellent things; for they may be blasted without the blessing of Heaven: and therefore ask that blessing humbly, and be not uncharitable to those that at present seem to want it, but comfort and help them. Remember Job suffered, and was afterwards prosperous.

And now, to conclude, 'Experience keeps a dear school; but fools will learn in no other, and scarce in that; for it is true we may give advice, but we cannot give conduct,' as poor Richard says. However, remember this, 'They that will not be counselled cannot be helped,' as poor Richard says; and further, that 'If you will not reason, she will surely rap their knuckles.'"

Thus the old gentleman ended his harangue. The people heard it, and approved the doctrine, and immediately practised the contrary, just as if it had been a common sermon; for the auction opened, and they began to buy extravagantly, notwithstanding all his cautions and their own fear of taxes. I found the good man had thoroughly studied my Almanacs, and digested all I had dropped on those topics during the course of twenty-five years. The frequent mention he made of me must have tired every one else; but my vanity was wonderfully delighted with it, though I was conscious that not a tenth part of the wisdom was my own, which he ascribed to me, but rather the gleanings that I had made of the sense of all ages and nations. However, I resolved to be the better for the echo of it; and though I had at first determined to buy stuff for a new coat, I went away, resolved to wear my old one a little longer.

As Franklin advanced in worldly prosperity, he endeavoured to make his personal acquirements keep pace with his upward progress in society; and amongst other accomplishments, applied himself sedulously to the study of the dead and modern languages, of which, besides his native tongue, he as yet scarcely knew any thing. The following is his own account of his private *curriculum*:—

"I had begun in 1733 to study languages. I soon made myself so much a master of the French, as to be able to read the books in that language with ease. I then undertook the Italian. An acquaintance, who was learning it, used often to tempt me to play chess with him. Finding this took up too much of the time I had to spare for study, I at length refused to play any game unless on this condition, that the victor in every game should have a right to impose a task, either of some part of the grammar to be got by heart, or in translations, &c., which tasks the vanquished was to perform upon honour before our next meeting. As we played pretty equally, we thus beat one another into that language. I afterwards, with a little painstaking, as much of the Spanish as to read their books. I have already mentioned that I had only a common school education, and that when I was about ten years old, after which I neglected that language entirely. But when I had attained an acquaintance with the French, Italian, and Spanish, I was surprised to find, on looking over a Latin Testament, that I understood more of that language than I had imagined, which encouraged me to apply myself again to the study of it; and I made great progress therein, the more success, as those preceding languages had greatly smoothed my way."

CIVIC PREFERMENTS AND DUTIES.

It was not to be supposed that a man of Franklin's comprehensive mind, and useful practical talents, would be allowed to remain long in the ranks of the people. Accordingly, in the year 1736, he was appointed clerk to the General Assembly at Pennsylvania. The appointment was made to his appointment the first on the next election, a new member of the house, on his return in a long speech. Franklin was again elected, much to his satisfaction; for the place was one of almost no direct emolument, but gave him an opportunity of making friends among the members, and ultimately to secure to himself the printing of most of the public papers, which was then shared with his rivals. The new member who resisted his re-election was a man of talent and character; and Franklin, although too independent to any cringing servility to him, perceived the importance of gaining his good opinion; and the experience upon for this purpose affords another instance of the shrewdness and knowledge of human nature learned that the gentleman possessed a very curious book, he wrote him a polite note, that he would do him the favour of lending days. The book was immediately sent; and a week was returned by the borrower, with epistle, expressive of his gratitude for the member was so much conciliated by the civility that the next time he met him in the house, he him with great civility; manifested ever a great desire to serve him; and they became intimate friends. "This is another instance Franklin, "of the truth of an old maxim I which says, 'He that has done you a kind more ready to do you another than he who self have obliged.' And it shows how much fitable it is prudently to remove, than to and continue, inimical proceedings." He was re-elected to the same post, without opposition several years successively. In the following he supplanted his rival in trade, Bradford, of deputy-postmaster for the state of P These honourable preferments induced him his thoughts to, and take a more active part affairs than he had hitherto done.

He first turned his attention to a state police, which was then in a shameful condition he soon effected a thorough reformation system. He suggested and promoted the of a fire insurance company, the first that in America. He afterwards successively self in organising a philosophical society, for the education of youth, and a militia for of the province. In short, every department civil government, as he tells us, and almost time, imposed some duty upon him. "Th says he, "put me into the commission of the corporations of the city chose me one of council; and the citizens at large elected burgess to represent them in assembly. station was the more agreeable to me, at length tired with sitting there to hear the which, as clerk, I could take no part, and

n so uninteresting, that I was induced to amuse elf with making magic squares, or circles, or any g, to avoid weariness; and I conceived my becoming ember would enlarge my power of doing good. I id not, however, insinuate that my ambition was not ared by all these promotions—it certainly was: for idering my low beginning, they were great things e; and they were still more pleasing as being so y spontaneous testimonies of the public good opinion, by me entirely unsolicited."

bout this period (1739), the celebrated preacher itfield arrived at Philadelphia from Ireland. He at first permitted to preach in some of the town rches; but the clergy soon took a dislike to him, l he was compelled to exercise his eloquence in the streets or fields. This circumstance, however, all displays of persecution in matters exclusively ected with private opinion, only rendered him the popular; and the effects of his oratory speedily ifested themselves.

It was wonderful," says Franklin, "to see the ge soon made in the manners of our inhabitants. a being thoughtless or indifferent about religion, rmed as if all the world were growing religious, so one could not walk through the town in an evening ut hearing psalms sung in different families of r street; and it being found inconvenient to mble in the open air, subject to its inclemencies, the ding of a house to meet in was no sooner proposed, persons appointed to receive contributions, than ient sums were soon received to procure the ground erect the building, which was one hundred feet and seventy broad; and the work was carried on much spirit as to be finished in a remarkably short "

leaving Philadelphia, Mr Whitfield went, preach- l the way, through the colonies to Georgia. The rnment of that province had then been recently menced, and was attempted by people entirely unfit uch an experiment. They were unable to endure fatigues and hardships of their situation, and ied in great numbers, leaving many helpless chil- with nothing to feed or clothe them. "The sight eir miserable situation," says Franklin, "inspired benevolent heart of Mr Whitfield with the idea of ding an orphan house there, in which they might be orted and educated. Returning northward, he ished up this charity, and made large collections; his eloquence had a wonderful power over the rts and purses of his hearers, of which I myself an instance. I did not disapprove of the design; as Georgia was then destitute of materials and rmen, and it was proposed to send them from Phi- phia at a great expense, I thought it would have better to have built the house at Philadelphia, and ght the children to it. This I advised; but he was tute in his first project, rejected my proposal, and erefore refused to contribute.

happened soon after to attend one of his sermons, e course of which I perceived he intended to finish a collection, and I silently resolved he should get ing from me. I had in my pocket a handful of per, three or four silver dollars, and five pistoles in As he proceeded, I began to soften, and con- ed to give the copper. Another stroke of his ora- made me ashamed of that, and determined me to the silver; and he finished so admirably, that I tied my pocket wholly into the collector's dish, gold all!"

t this time there was no military defensive force in sylvania. The inhabitants were mostly Quakers, neglected to take any measures of precaution nst the dangers to which, from the French posses- s in Canada, they were continually exposed. All xertions of the governor of the province to induce Quaker assembly to pass a militia law, proved in- tual. Franklin thought something might be done subscription among the people; and to pave the for this, he wrote and published a pamphlet called "Plain Truth." In this he clearly exposed their helpless and perilous situation, and demonstrated the necessity of co-operating for their mutual defence. The pamphlet had a sudden and surprising effect. A meeting of the citizens was held, at which proposals of the intended union, previously drawn up and printed by Franklin, were distributed about the room, to be signed by those who approved of them; and when the company separated, it was found that above twelve hundred signatures had been appended to the papers. Other copies were distributed through the province, and the subscribers at length amounted to upwards of ten thousand! All these individuals furnished themselves, as soon as they could, with arms; formed themselves into companies and regiments; chose their officers, and had themselves regularly instructed in military exercises. The women made subscriptions amongst themselves, and provided silk colours, which they presented to the companies, embellished with devices and mottoes furnished by Franklin. Such influence has one master-mind amongst his fellows in a time of emergency!

Franklin's modesty, however, was more than commensurate with his patriotism. The officers of the companies composing the Philadelphia regiment unanimously chose him for their colonel, but he declined the office in favour of a man of greater wealth and influence, who, on his recommendation, was immediately elected. These exertions of Franklin procured him great confidence from the governor and council, who consulted him on all their public measures. Notwithstanding, too, of the passive principles of the Quakers, it was soon seen that the precautions of military defence were any thing but disagreeable to them. A distinguished individual of their number, Mr Logan, published an address declaring his approbation of defensive war, and supporting his opinion by able and elaborate arguments.

This gentleman, who came over from England when a young man, as secretary to the famous William Penn, used to relate an anecdote respecting his old master, which is sufficiently amusing. During their voyage, they were chased by an armed vessel, supposed to be an enemy. Their captain prepared for defence, but told Penn and his company of Quakers that he did not expect their assistance, and that they might retire into the cabin. This notification they all complied with, excepting Logan, who remained on deck, and was quartered to a gun. The supposed enemy proved a friend, so that there was no fighting; but when the secretary carried the joyful news for his friends in the cabin, Penn reproved him severely for staying on deck, and lending his assistance in defence of the vessel, as being a breach of the principles of their society. Logan, nettled at this comment on his courageous conduct, which was made before the whole company, replied, "I being thy servant, why did thee not order me to come down? but thee was willing enough that I should stay and help to fight the ship, when thee thought there was danger!"

ELECTRICAL DISCOVERIES.

It would, perhaps, have been desirable to have followed Franklin through the remainder of his public and political career, without pausing to advert to other pursuits, entirely unconnected therewith, to which he devoted himself. We find, however, that the chronological violence of which we would in that case necessarily be guilty, would only serve to confuse our narrative. We will now, therefore, proceed to introduce him to our readers in an entirely new character from any in which they have yet seen him; for, in the language of the poet, his truly was

> "A mind so various that he seemed to be
> Not one, but all mankind's epitome."

Down to the close of the sixteenth century, all that was known of the principle of electricity was the discovery of a power inherent in amber,* and one or two other

* The term electricity is derived from the Greek word *electron*, amber.

annals of electricity for the accidental discovery of the possibility of accumulating large quantities of the electric fluid, by means of what was called the Leyden jar, or phial. M. Cuneus, of that city, happened one day, while repeating some experiments which had been originally suggested by M. Von Kleist, Dean of the Cathedral in Camin, to hold in one hand a glass vessel, nearly full of water, into which he had been sending a charge from an electrical machine, by means of a wire dipped into it, and communicating with the prime conductor, or insulated non-electric, exposed in the manner we have already mentioned to the action of the excited cylinder. He was greatly surprised, upon applying his other hand to disengage the wire from the conductor, when he thought that the water had acquired as much electricity as the machine could give it, by receiving a sudden shock in his arms and breast, much more severe than any thing of the kind he had previously encountered in the course of his experiments. The same thing, it was found, took place when the glass was covered, both within and without, with any other conductors than the water and the human hand, which had been used in this instance; as, for example, when it was coated on both sides with tinfoil, in such a manner, however, that the two coatings were completely separated from each other, by a space around the lip of the vessel being left uncovered. Whenever a communication was formed by the interposition of a conducting medium between the inside and outside coating, an instant and loud explosion took place, accompanied with a flash of light, and the sensation of a sharp blow, if the conductor employed was any part of the human body. The first announcement of the wonders of the Leyden phial excited the curiosity of all Europe. The accounts given of the electric shock by those who first experienced it are perfectly ludicrous, and well illustrate how strangely the imagination is acted upon by surprise and terror, when novel or unexpected results suddenly come upon it.

The extraordinary phenomena of the Leyden jar, soon, of course, attracted the attention of Franklin, and his inquisitive mind set itself to find out the reason of such strange effects, which astonished and perplexed the ablest philosophers of Europe. Out of his speculations arose the ingenious and beautiful theory of the action of the electric influence which is known by his name, and which has ever been received as the best, because the simplest and most complete, demonstration

edly one of the most beautiful
found in the whole compass of sci

ct consequence of the fundamental principle of
n theory, according to which the repulsive ten-
of the particles of electricity towards each other,
ioning the fluid to retire, in every case, from the
or to the surface of bodies, drives it with especial
towards points and other prominences, and thus
rs its escape through such outlets; while, on the
hand, the more concentrated attraction which the
r of a pointed body, as compared with that of a
one, exerts upon the electricity to which it is pre-
d, brings it down into its new channel in a denser
m. In possession, however, of the fact, we find
oncluding the paper we have mentioned as fol-
—"The electric fluid is attracted by points. We
t know whether this property be in lightning;
ace they agree in all the particulars in which we
ready compare them, it is not improbable that
agree likewise in this. Let the experiment be

of this idea, his attention was one day drawn to
which a boy was flying, and it suddenly occurred
that here was a method of reaching the clouds
able to any other. Accordingly, he immediately
large silk handkerchief, and, stretching it over
ss sticks, formed in this manner his simple appa-
for drawing down the lightning from its cloud.
after, seeing a thunder storm approaching, he
walk into a field in the neighbourhood of the
n which there was a shed, communicating his
ons, however, to no one but his son, whom he
ith him to assist him in raising the kite: this was
e 1752.

kite being raised, he fastened a key to the lower
nity of the hempen string, and then insulating it
aching it to a post by means of silk, he placed
f under the shed, and waited the result. For
time no signs of electricity appeared. A cloud,
ently charged with lightning, had even passed over
without producing any effect. At length, how-
just as Franklin was beginning to despair, he ob-
some loose threads of the hempen string rise and
erect, exactly as if they had been repelled from
ther by being charged with electricity. He imme-
y presented his knuckle to the key, and, to his
ressible delight, drew from it the well-known elec-
spark. He said afterwards that his emotion was
eat at this completion of a discovery which was
ke his name immortal, that he heaved a deep sigh,
elt that he could that moment have willingly died.
e rain increased, the cord became a better con-
r, and the key gave out its electricity copiously.
the hemp been thoroughly wet, the bold experi-
r might, as he was contented to do, have paid for
scovery with his life. He afterwards brought down
ightning into his house, by means of an insulated
rod, and performed with it, at his leisure, all the
riments that could be performed with electricity.
he did not stop here. His active and practical
was not satisfied even with the splendid discovery,
he had turned it to a useful end. It suggested to
as is well known, the idea of a method of pre-
ng buildings from lightning, which is extremely
e and cheap, as well as effectual, consisting, as it
in nothing more than attaching to the building a
ed metallic rod, rising higher than any part of it,
communicating at the lower end with the ground.
rod the lightning is sure to seize upon, in prefe-
e to any part of the building; by which means it
nducted to the earth, and prevented from doing
injury. There was always a strong tendency in
klin's philosophy to these practical applications.
anklin's discoveries did not at first attract much
tion in England; and, in fact, he had the mortifi-
n to hear that his paper on the similarity between
ning and electricity had been ridiculed when read
e Royal Society. Having fallen, however, into the
s of the naturalist Buffon, that celebrated man
lated and published it at Paris, when it speedily
ed the astonishment of all Europe. What gave

his book the more sudden and general celebrity, was the success of one of its proposed experiments for drawing lightning from the clouds, made at Marly. This engaged the public attention every where. The "Philadelphia experiments," as they were called, were performed before the king and court, and all the curious of Paris flocked to see them. Dr Wright, an English physician, being at Paris at the time, wrote to a member of the Royal Society of London, with an account of these wonders, and stating the surprise of all the learned men abroad of Franklin's writings being so little noticed in England. The society were thus in a manner compelled to pay more attention to what they had previously considered as chimerical speculations, "and soon," says Franklin, "made me more than amends for the slight with which they had before treated me. Without my having made any application for that honour, they chose me a member, and voted that I should be excused the customary payments, which would have amounted to twenty-five guineas, and ever since have given me their Transactions gratis. They also presented me with the gold medal of Sir Godfrey Copley for the year 1753, the delivery of which was accompanied with a very handsome speech of the president, Lord Macclesfield, wherein I was highly honoured."

Although the numerous important public duties which Franklin was called upon latterly to discharge, chiefly engrossed his time, he still returned to his philosophical studies on every occasion that offered, and made several curious and interesting discoveries.

Perhaps no philosopher ever stood on a prouder eminence in the world's eye than Franklin during the latter half of his life. The obscurity of his origin served but to make his elevation the more brightly conspicuous; and honours were showered on him from all quarters of the civilised world. In 1757 he visited England, and before his return made a tour in Scotland, where he formed an intimacy with Lord Kames, and had the degree conferred upon him of Doctor of Laws by the University of St Andrews. In 1764 he again visited England, from which he proceeded to the continent of Europe. In Holland, Germany, and France, he was received with the greatest testimonies of respect from all men of science and distinction. At Paris, Louis XV. honoured him with the most distinguished marks of his favour.

POLITICAL CAREER.

This part of Franklin's life need only be very generally touched on, the scenes and transactions in which he bore a part having long since become matter of history, with which almost every individual is now more or less acquainted. We have before mentioned that he was elected a member of the General Assembly of Pennsylvania, as burgess for the city of Philadelphia, in 1747. Warm disputes at this time subsisted between the assembly and the proprietaries,* each contending for what they conceived to be their just rights. Franklin, a friend to the interests of *the many* from his infancy, speedily distinguished himself as a steady opponent of the claims of the proprietaries, and he was soon looked up to as the head of the opposition. His influence with the assembly is said to have been very great. This arose not from any superior powers of elocution; he spoke but seldom, and he never was known to make any thing like an elaborate harangue. "His speeches," says his intimate friend, the late Dr Stuber of Philadelphia, "frequently consisted of but a single sentence, or of a well-told story, the moral of which was always obviously to the point. He never attempted the flowery fields of oratory. His manner was plain and mild; his style of speaking was, like that of his writings, simple, unadorned, and remarkably concise. With this plain manner, and his penetrating and solid judgment, he was able to confound the most eloquent and subtle of his adversaries, to confirm the opinions of his friends, and

president-general, appointed by the crown, and by a grand council, consisting of members chosen by the representatives of the different colonies; the whole executive authority to be committed to the president-general; the legislative to the grand council and president jointly; and all laws to be approved of by the king. This plan was unanimously approved of by the commissioners for the crown and the colonies appointed to consult on the question, but its final fate was singular. It was rejected by the ministry of Great Britain as too democratical, and by every local assembly as too despotic. These verdicts were, perhaps, the best proof of its excellence, and of its having steered exactly in the middle betwixt the interests of both.

The British government having thus rejected a proposal of internal defence in the colonies, they were soon obliged to adopt measures of another sort for their protection. Aggressive operations were again threatened by the French; and in 1754, General Braddock was dispatched from England with two regiments of regular English troops to resist them. The troops were landed at Alexandria, and marched thence to Fredericktown in Maryland, where they halted for carriages to transport their baggage, ammunition, &c., to the frontiers. Great reluctance was manifested by the country people to supply these, and, in fact, so few were sent in, and so many other difficulties occurred, that the general was about to abandon the expedition altogether. In this dilemma he was fortunately joined by Franklin, who, aware of the necessity and importance of the expedition, asked General Braddock what recompense he would afford to the owners for the use of their waggons and horses. General Braddock referred the terms to himself; they were drawn up and accepted; and Franklin immediately published them in an advertisement, with an animated appeal from himself to the loyalty and patriotism of his countrymen. The consequence was, that, in two weeks, 150 waggons and 260 horses poured into the camp, the owners of which, however, declined the security of the British commander for compensation, and insisted on having the personal bond of Franklin. This he accordingly gave them, and even advanced several hundred pounds of his own in present payment.

The expedition accordingly set forward, and its disas-

on the breaking out of the fatal disturbances in quence of Mr Grenville's Stamp Act, Franklin had returned to England, as agent for Pennsylvania other states. During his residence in England, nsulted, with unremitting industry, the best inte- of his native country. He was every where re- d with respect, on account of his reputation as a r and philosopher. Franklin was unwearied in his s to bring about a reconciliation. He had frequent views with Lord Howe and Lord Chatham, and distinguished English statesmen, who entertained m the highest respect and esteem. Most of the time g his present residence in England was occupied in vain efforts. It is well known that the first violent nstrations against the imposition of the Stamp Act, out in Franklin's native place, Boston, the capital state of Massachussets. The governor, Hutchin- and other functionaries, wrote to the home govern- , recommending the adoption of the most rigorous ive measures, and inveighing in unmeasured terms st the leading characters of the state. By some countable means, these letters fell into Franklin's s ere they reached their destination. He instantly mitted them back to the assembly at Massachus- who, enraged at the conduct of the governor, sent tition to the king, praying for his dismissal, and klin was appointed to present it. As might have expected, the petition was dismissed as "frivolous exatious;" and Franklin incurred so much obloquy is interception of the governor's dispatches (the of which was never discovered), that he was dis- d from his office of deputy-postmaster-general. till continued in England, however, and left nothing ed to effect a reconciliation between the mother- try and the colonies; but finding all his endeavours alling, he returned to America in 1775. The day his arrival, he was elected by the legislature of sylvania as a delegate to Congress. Hostilities had commenced; but it would be repeating a thrice- tale to enter into any account of the protracted and ly struggle that ensued, or the nature of its termi- n. In 1778, Franklin was sent as ambassador to ourt of France, where he soon brought about an nce between that nation and the North American s. When the British ministry at length saw the ssity of recognising the independence of the states, definitive treaty to that effect was signed at Paris he 3d of September 1783, by Dr Franklin, Mr ms, and Mr Jay, for the states, on the one hand; by Mr David Hartley, for Great Britain, on the r. Franklin continued at Paris for the two fol- ng years; but at last, by his own urgent request, recalled. Shortly after his return, he was elected ident of the supreme executive council, and lent is still perfect energies to consolidating the infant rnment. Age and infirmities, however, claimed r usual ascendancy; and in 1788 he retired wholly public life.

DEATH.

ranklin's last public act—and it was one in beau- accordance with the whole tenor of his life—was ing his signature, as president of the Anti-Slavery ety, to a memorial presented to the House of Re- entatives, praying them to exert the full powers usted to them to discourage the revolting traffic in human species. This was on the 12th of February 0. From this day forward, he was confined almost tantly to bed with the stone, from which he suffered most excruciating agony. Yet, when his paroxysms ain drew forth, as they did occasionally, an irre- sible groan, he would observe, he was afraid he did bear his sufferings as he ought—acknowledged his eful sense of the many blessings he had received n the Supreme Being, who had raised him from an low beginnings to such high rank and considera

among men, and made no doubt but his present afflictions were kindly intended to wean him from a world in which he was no longer fit to act the part assigned him. He latterly sunk into a calm lethargic state; and, on the 17th April 1790, about eleven o'clock at night, he quietly expired. He was then aged exactly eighty-four years and three months. The following epitaph, written by himself many years previous to his death, was inscribed on his tombstone:—

"The Body of BENJAMIN FRANKLIN, Printer [like the cover of an old book, its contents torn out, and stript of its lettering and gilding], lies here food for worms; yet the work itself shall not be lost, for it will (as he believed) appear once more in a new and more beautiful edition, corrected and amended by THE AUTHOR."

CHARACTER.

In looking back on Franklin's career, it is evident that the principal feature in his character was *worldly prudence*—not in the usual and selfish acceptation of the term, but that prudence, founded on true wisdom, which dictates the practice of honesty, industry, frugality, temperance, in short, all those qualities which may be classified under the name of "moral virtues"—as being the only certain means of obtaining distinction, respect, independence, and mental cheerfulness. There is no other writer who inculcates lessons of practical wisdom in a more agreeable and popular manner, and we much regret that the limits of this sheet prevent our giving many extracts illustrative of this quality. His whole conduct and writings, indeed, present the somewhat singular union of great genius with practical good sense, and of singular worldly shrewdness with the loftiest integrity of principle. The greatest worldly honours—and few have attained higher—could not for a moment make him forget or deviate from the principles with which he started in life. Ever keeping before his mind his own origin and rise, he justly considered every man to be originally on a par in as far as regarded real intrinsic worth; and, equally by precept and example, contributed more, perhaps, than any individual who ever existed, to breaking down those invidious bars to eminence and success in life which the conventional habits and artificial feelings of society had theretofore interposed to the elevation of those unblessed by birth and fortune.

As the present biography must be considered as more immediately instructive to the industrious and productive portion of mankind, we shall conclude it by giving the following "Advice to a Young Tradesman," written by Franklin at the time when his industrious and frugal habits were just beginning to be rewarded with independence and worldly respect.

"Remember that *time* is money. He that can earn ten shillings a-day by his labour, and goes abroad, or sits idle one-half of that day, though he spends but sixpence during his diversion or idleness, ought not to reckon *that* the only expense; he has really spent, or rather thrown away, five shillings besides.

Remember that *credit* is money. If a man lets his money lie in my hands after it is due, he gives me the interest, or so much as I can make of it during that time. This amounts to a considerable sum where a man has good and large credit, and makes good use of it.

Remember that money is of a prolific, generating nature. Money can beget money, and its offspring can beget more, and so on. Five shillings turned is six; turned again is seven and threepence; and so on till it becomes a hundred pounds. The more there is of it, the more it produces every turning, so that the profits rise quicker and quicker. He that kills a breeding sow, all her offspring to the thousandth generation. murders a crown, destroys all that it might luced, even scores of pounds.

ber that six pounds a-year is but a groat a- this little sum (which may be daily wasted time or expense, unperceived) a man of credit his own security, have the constant possession and use of a hundred pounds. So much is the turned by an industrious man, produces great

Remember this saying, 'The good paym of another man's purse.' He that is known tually, and exactly to the time he promises, time, and on any occasion, raise all the money can spare. This is sometimes of great use. A try and frugality, nothing contributes more ing of a young man in the world than punc justice in all his dealings: therefore, never rowed money an hour beyond the time you lest a disappointment shut up your friend's ever.

The most trifling actions that affect a m are to be regarded. The sound of your ham in the morning, or nine at night, heard by makes him easy six months longer; but if he at a billiard-table, or hears your voice at a tav you should be at work, he sends for his money day; demands it before he can receive it in a

It shows, besides, that you are mindful of owe; it makes you appear a careful as well as man, and that still increases your credit.

Beware of thinking all your own that you and of living accordingly. It is a mistake t people who have credit fall into. To prevent an exact account, for some time, both of your and your income. If you take the pains at first tion particulars, it will have this good effect— discover how wonderfully small trifling expen up to large sums, and will discern what m been, and may for the future be saved, with sioning any great inconvenience.

In short, the way to wealth, if you desire plain as the way to market. It depends chief words—*industry* and *frugality;* that is, wast *time* nor *money*, but make the best use of both out industry and frugality nothing will do, them every thing. He that gets all he can and saves all he gets (necessary expenses e will certainly become *rich*—if that Being wh the world, to whom all should look for a bl their honest endeavours, doth not, in his w dence, otherwise determine."

About forty years later, after a long life of e he penned the following similar admonitions "Necessary Hints to those that would be Ric

"The use of money is all the advantage t having money.—For six pounds a-year you the use of one hundred pounds, provided man of known prudence and honesty.—He th a groat a-day idly, spends idly about six pound which is the price for the use of one hundr He that wastes idly a groat's worth of his tim one day with another, wastes the privilege of hundred pounds each year.—He that idly shillings' worth of time, loses five shillings, as prudently throw five shillings into the sea loses five shillings, not only loses that sum, advantages that might be made by turning it which, by the time that a young man becom amount to a considerable sum of money.— that sells upon credit, asks a price for wh equivalent to the principal and interest of for the time he is to be kept out of it; th that buys upon credit, pays interest for wh and he that pays ready money, might let t out to use; so that he that possesses any th bought, pays interest for the use of it.—Yet goods, it is best to pay ready money, becau sells upon credit expects to lose five per c debts; therefore, he charges, on all he sell dit, an advance that will make up that de Those who pay for what they buy upon credi share of this advance.—He that pays re escapes, or may escape, that charge.

PRESERVATION OF HEALTH.

AN being, supposing him to be soundly constituted at, will continue in health till he reaches old age, ded that certain conditions are observed, and no ous accident shall befall. This is a proposition ll supported by an extensive observation of facts, may be regarded as established. It becomes, of , important to ascertain what are the conditions ial to health, in order that, by their observance, y preserve for ourselves what is justly esteemed greatest of earthly blessings, and dwell for our lly appointed time upon the earth. A general intance with these conditions may be easily at- by all, and to pay them obedience is much more the power of individuals than is generally sup-

leading conditions essential to health may be numerated:—1. A constant supply of pure air; sufficiency of nourishing food, rightly taken; anliness; 4. A sufficiency of exercise to the vari- rgans of the system; 5. A right temperature; sufficiency of cheerful and innocent enjoyments; Exemption from harassing cares.

AIR.

common air is a fluid composed mainly of two in certain proportions; namely, oxygen as 20 and en as 80 parts in a hundred, with a very minute n of carbonic acid gas. Such is air in its pure ght state, and such is the state in which we re- it for respiration. When it is loaded with any ture of a different kind, or its natural propor- are in any way deranged, it cannot be breathed t producing injurious results. We also require to apt to appear a large quantity of this element lthy existence. The lungs of a healthy full-grown will inhale the bulk of twenty cubic inches at every ation, and he will use no less than fifty-seven ads in twenty-four hours.

r, there are various circumstances which tend to und us at times with vitiated air, and which must dingly be guarded against. That first calling for ion is the miasma or noxious quality imparted to r in certain districts by stagnant water and decay- getable matter. It is now generally acknowledged his noxious quality is in reality a subtle poison, acts on the human system through the medium lungs, producing fevers and other epidemics. A instance of its acting on a great scale is presented e Campagna di Roma, where a large surface is ed in a marshy state. The air arising from that ory at certain seasons of the year, obliges the in- ants of the adjacent districts of the city to desert homes, in order to escape its pernicious influence. arshes, and low damp grounds of every kind, pro- more or less miasma, and it is consequently dange- o live upon or near them. Slightly elevated ground should, accordingly, in all cases, be chosen for both single houses and towns. Tanks and collections of water of every kind are dangerous beneath or near a house, because, unless their contents be constantly in a state of change, which is rarely the case, their tendency is to send up exhalations of a noxious kind. A few years ago, the eldest son of an English nobleman—a youth of great promise, and who had recently become a husband and father—died of a fever which was traced to the opening of an old reservoir of water underneath the country-house in which he dwelt.*

Putrid matter of all kinds is another conspicuous source of noxious effluvia. The filth collected in ill-regulated towns—ill-managed drains—collections of decaying animal substances, placed too near or within private dwellings—are notable for their effects in vitiating the atmosphere, and generating disease in those exposed to them. In this case, also, it is a poison diffused abroad through the air which acts so injuriously on the human frame. This was probably the main cause of the plagues which visited European cities during the middle ages. In those days there were no adequate provisions for cleaning cities, and the consequence was, that large collections of filth were accumulated. The noxious air diffused by these means through the narrow streets and confined dwellings would tend to the most fatal effects. In old drains there is generated a gas (sulphureted hydrogen), which is calculated to produce dreadful consequences amongst those exposed to it. It has lately been discovered, that it is the presence of this gas in the sea near the eastern coast of tropical Africa, which causes the peculiar unhealthiness of that region. It is ascertained that small animals, such as birds, die, when the air they breathe contains one fifteen-hundredth part of sulphureted hydrogen, and that an infusion six times greater will kill a horse. It follows, that we can scarcely attach too much importance to measures for cleaning cities and improving drains. There are as yet no large towns in Britain kept in a state so clean as is desirable for the health of their inhabitants; and the metropolis itself is amongst those which are most defective in this respect.

The human subject tends to vitiate the atmosphere for itself, by the effect which it produces on the air which it breathes. Our breath, when we draw it in, consists of the ingredients formerly mentioned; but it is in a very different state when we part with it. On passing into our lungs, the oxygen, forming the lesser ingredient, enters into combination with the carbon of the venous blood (or blood which has already performed its round through the body); in this process, about two-fifths of the oxygen is abstracted and sent into the blood, only the remaining three-fifths being expired, along with the nitrogen nearly as it was before.

* Viscount Milton, son of the present Earl Fitzwilliam, was the person here alluded to.

In place of the oxygen consumed, there is expired an equal volume of carbonic acid gas, such gas being a result of the process of combination just alluded to. Now, carbonic acid gas, in a larger proportion than that in which it is found in the atmosphere, is noxious. The volume of it expired by the lungs, if free to mingle with the air at large, will do no harm; but, if breathed out into a close room, it will render the air unfit for being again breathed. Suppose an individual to be shut up in an air-tight box: each breath he emits throws a certain quantity of carbonic acid gas into the air filling the box; the air is thus vitiated, and every successive inspiration is composed of worse and worse materials, till at length the oxygen is so much exhausted, that it is insufficient for the support of life. He would then be sensible of a great difficulty in breathing, and in a little time longer he would die.

Most rooms in which human beings live are not strictly close. The chimney and the chinks of the door and windows generally allow of a communication to a certain extent with the outer air, so that it rarely happens that great immediate inconvenience is experienced in ordinary apartments from want of fresh air. But it is at the same time quite certain that, in all ordinary apartments where human beings are assembled, the air unavoidably becomes *considerably vitiated*, for in such a situation there cannot be a sufficiently ready or copious supply of oxygen to make up for that which has been consumed, and the carbonic acid gas will be constantly accumulating. This is particularly the case in bedrooms, and in theatres, churches, and schools. An extreme case was that of the celebrated Black Hole of Calcutta, where a hundred and forty-six persons were confined for a night in a room eighteen feet square with two small windows. Here the oxygen scarcely sufficient for the healthy supply of one person, was called upon to support a large number. The unfortunate prisoners found themselves in a state of unheard-of suffering, and in the morning all were dead but twenty-three, some of whom afterwards sunk under putrid fever brought on by breathing so long a tainted atmosphere.

Although the vitiation of the air in ordinary apartments and places of public assembly does not generally excite much attention, it nevertheless exercises a certain unfavourable influence on health in all the degrees in which it exists. Perhaps it is in bedrooms that most harm is done. These are generally smaller than other rooms, and they are usually kept close during the whole night. The result of sleeping in such a room is very injurious. A common fire, from the draught which it produces, is very serviceable in ventilating rooms, but it is at best a defective means of doing so. The draught which it creates generally sweeps along near the floor between the door and the fire, leaving all above the level of the chimney-piece unpurified. Yet scarcely any other arrangement is any where made for the purpose of changing the air in ordinary rooms. To open the window is a plan occasionally resorted to, but it is not always agreeable in our climate, and sometimes it produces bad consequences of a different kind.

It would nevertheless be easy to produce an effective draught from any room in which a fire is kept. It is only necessary to make an aperture into the flue, near the ceiling of the room, and insert therein a tin tube, with a valve at the exterior, capable of opening inwards, but closing when at rest or when a draught is sent the contrary way. The draught produced by the fire in the flue would cause a constant flow of air out of the *upper part* of the room (where most vitiated); and the valve would be an effectual protection against back-smoke, should there be the least tendency to it. This plan is adopted in Buckingham Palace. It could be applied to any existing house at a mere trifle of expense.

A more effectual plan, and one which operates when there is no fire in the room, is to establish a tin tube of two or three inches diameter out of each apartment to be ventilated, causing them all to meet in one general tube, the extremity of which passes into a flue—for example, that of the kitchen, which cold. Thus there might be a constant pass air into and through every room of a large that it would be at all times as healthy in as the open fields. At the same time, the by means of graduated valves, be regulated gree which might be deemed agreeable.

FOOD.

The second requisite for the preservation is a sufficiency of nutritious food.

Organic bodies, in which are included ve well as animals, are constituted upon the pr *continual waste of substance supplied by* con *tion.*

The Nutritive System of animals, from the humblest of these to the highest, comp *alimentary tube or cavity*, into which food and from which, after undergoing certain ch diffused by means of smaller vessels thro whole structure. In the form of this tube, other apparatus connected with the taking of are, in different animals, varieties of struc which are respectively in conformity with p in the quality and amount of food which the animals are designed to take. The harmon served in these arrangements is remarkably of that Creative Design to be traced in all t

MAN DESIGNED TO LIVE ON A MIXED DI

Some animals are formed to live upon veg stances alone; others are calculated to liv flesh of other animals. Herbivorous anim former are called, have generally a long a cated alimentary tube, because the nutritio such food, being comparatively small in pr the whole bulk, requires a greater space i be extracted and absorbed into the system. for example, has a series of intestines tw times the length of its body. For the oppos carnivorous or flesh-devouring animals, as tribe of quadrupeds, and the rapacious bi generally a short intestinal canal. The form animals are furnished with teeth, calculate broad and flat surfaces, as well as by the lat ment of the jaws in which they are set, to m the herbage and grain eaten by them. But vorous animals, with wide-opening jaws, ha sharp fangs to seize and tear their prey. Th liarities of structure mark sufficiently the nature with respect to the kinds of food requi two different classes of animals for their supp

The human intestinal canal being of medi and the human teeth being a mixture of the it necessarily follows that man was designed t vegetable and animal food. As no animal can ably or healthily except in conformity with th its constitution, it follows that man will not t less with a mixture of animal and vegetable fo followers of Pythagoras argued, from the c putting animals to death, that it was proper t vegetables alone; and many eccentric persons t times have acted upon this rule. But the uni Nature speak a different language; and, if we faith in these, we cannot for a moment doubt th ture of animal food is necessary for our well-b the other hand, we cannot dispense with vegeta without injurious consequences. In that case, in a medium alimentary canal a kind of food calculated for a short one, thus violating an ment of the most important nature. A balance the two kinds of food is what we should observ would desire to live a natural and consequently life.

RULES CONNECTED WITH EATING.

In order fully to understand how to eat, wha

ow to conduct ourselves after eating, it is neces-
hat we should be acquainted in some measure
he *process of nutrition*—that curious series of
ions by which food is received and assimilated
· system, in order to make good the deficiency
ed by waste.

d is first received into the mouth, and there the
ions in question may be said to commence. It is
to be chewed (or masticated) and mixed with
preparatorily to its being swallowed or sent into
omach. Even in this introductory stage, there
rtain rules to be observed. Strange as it may
, to know *how to eat* is a matter of very consi-
e importance.

ny persons, thinking it all a matter of indifference,
haps unduly anxious to dispatch their meals, eat
st. If we are to believe the accounts of travellers,
ole of the mercantile classes in New England eat
dly, seldom taking more than ten minutes to
ast, and a quarter of an hour to dinner. They
e their meat precipitately into their mouths, and
w it almost without mastication. This is con-
to an express law of nature, as may be easily

d, on being received into the mouth, has two pro-
to undergo, both very necessary to digestion. It
be masticated, or chewed down, and also to re-
an admixture of saliva. The saliva is a fluid
from certain glands in and near the mouth, and
aching in character to the gastric juice afterwards
described. Unless food be well broken down or
ated, and also well mixed up with the salivary
it will be difficult of digestion. The stomach is
alled upon to do, besides its own proper duty, that
properly belongs to the teeth and saliva, and it
s overburdened and embarrassed, often in a very
s manner. The pains of indigestion are the im-
te consequence, and more remote injuries follow.
importance of the saliva has been shown in a
ng manner, on several occasions when food was
ed into the stomach otherwise than through the
. A gentleman, who, in consequence of a stric-
n the gullet, had his food introduced by an aper-
nto that tube, used to suffer severely from indi-
n. It is recorded of a criminal, who, having cut
roat in prison without fatal consequences, required
his food introduced by means of a tube inserted
mouth, that, every time he was fed, there was
usion of saliva to the amount of from six to eight
s. We cannot suppose that a fluid of a peculiar
cter would have been prepared in such quantity,
water would serve as well merely to wet the food,
ad not been designed to act an important part in
siness of nutrition. With regard to mastication,
vidence of its importance is still more clear. A
ears ago, a young Canadian, named Alexis St
n, had a hole made by a shot into his stomach,
healed without becoming closed. It was there-
ossible to observe the whole operations of the
ch with the eye. His medical attendant, Dr
nont, by these means ascertained that, when a
of solid food was introduced, the gastric juice
merely on its outside. It was only when the food
omminuted, or made *small*, that this fluid could
erform its function. When the stomach finds
totally unable to digest a solid piece of food, it
rejects it by vomiting, or passes it on into the
here it produces an irritating effect, and is apt to
on an attack of cholic or flatulency.

s therefore to be concluded that *a deliberate mas-*
n of our food is conducive to health, and that fast
is injurious, and sometimes even dangerous.

food, having been properly masticated, is, by the
of the tongue, thrown into the gullet. It then
ads into the stomach, not so much by its own
y, as by its being urged along by the contrac-
and motions of the gullet itself. The stomach
e considered as an expansion of the gullet, and
ief part of the alimentary canal. It is, in fact,
a membranous pouch or bag, very similar in shape to a bagpipe, having two openings, the one by which the food enters, the other that by which it passes out. It is into the greater curvature of the bag that the gullet enters; it is at its lesser that it opens into that adjoining portion of the canal into which the half-digested mass is next propelled.

When food has been introduced, the two orifices close, and that which we may term the second stage in the process of digestion commences. The mass, already saturated with saliva, and so broken down as to expose all its particles to the action of the gastric juice, is now submitted to the action of that fluid, which, during digestion, is freely secreted by the vessels of the stomach. The most remarkable quality of this juice is its solvent power, which is prodigious.

The food exposed to this dissolving agency, is converted into a soft, grey, pulpy mass, called chyme, which, by the muscular contraction of the stomach, is urged on into the adjoining part of the alimentary canal, called the duodenum. This is generally completed in the space of from half an hour to two or three hours; the period varying according to the nature and volume of the food taken, and the mastication and insalivation it has undergone.

In the duodenum, the chyme becomes intimately mixed and incorporated with the bile and pancreatic juices; also with a fluid secreted by the mucous follicles of the intestine itself. The bile is a greenish, bitter, and somewhat viscid fluid, secreted by the liver, which occupies a considerable space on the right side of the body immediately under the ribs. From this organ the bile, after a portion of it has passed up into the adjacent gall-bladder, descends through a small duct, about the size of a goose-quill, into the duodenum. The chyme, when mixed with these fluids, undergoes a change in its appearance; it assumes a yellow colour and bitter taste, owing to the predominance of the bile in the mass; but its character varies according to the nature of the food that has been taken. Fatty matters, tendons, cartilages, white of eggs, &c., are not so readily converted into chyme as fibrous or fleshy, cheesy, and glutinous substances. The chyme, having undergone the changes adverted to, is urged by the peristaltic motion of the intestines onwards through the alimentary canal. This curious motion of the intestines is caused by the contraction of the muscular coat which enters into their structure, and one of the principal uses ascribed to the bile is that of stimulating them to this motion. If the peristaltic motion be diminished, owing to a deficiency of bile, then the progress of digestion is retarded, and the body becomes constipated. In such cases, calomel, the blue pill, and other medicines, are administered for the purpose of stimulating the liver to secrete the biliary fluid, that it may quicken by its stimulating properties the peristaltic action. But this is not the only use of the bile: it also assists in separating the nutritious from the non-nutritious portion of the alimentary mass, for the chyme now presents a mixture of a fluid termed *chyle*, which is in reality the nutritious portion eliminated from the food. The chyme thus mixed with chyle arrives in the small intestines; on the walls of which a series of exquisitely delicate vessels ramify in every direction. These vessels absorb or take up the chyle, leaving the rest of the mass to be ejected from the body. The chyle, thus taken up, is carried into little bodies or glands, where it is still further elaborated, acquiring additional nutritious properties; after which, corresponding vessels, emerging from these glands, carry along the fluid to a comparatively large vessel, called the thoracic duct, which ascends in the abdomen along the side of the back-bone, and pours it into that side of the heart to which the blood that has already circulated through the body returns. Here the chyle is intimately mixed with the blood, which fluid is now propelled into the lungs, where it undergoes, from being exposed to the action of the air we breathe, the changes necessary to render it again fit for circulation. It is in the lungs, therefore, that the process of digestion is completed;

the blood has now acquired those nutritient properties from which it secretes the new particles of matter adapted to supply the waste of the different textures of the body.

When food is received into the stomach, the secretion of the gastric juice immediately commences; and when a full meal has been taken, this secretion generally lasts for about an hour. It is a law of vital action, that when any living organ is called into play, there is immediately an increased flow of blood and nervous energy towards it. The stomach, while secreting the bile, displays this phenomenon, and the consequence is that the blood and nervous energy are called away from other organs. This is the cause of that chilliness at the extremities which we often feel after eating heartily. So great is the demand which the stomach thus makes upon the rest of the system, that, during and for some time after a meal, we are not in a condition to take strong exercise of any kind. Both body and mind are inactive and languid. They are so, simply because that which supports muscular and mental activity is concentrated for the time upon the organs of digestion. This is an arrangement of nature which a regard to health requires that we should not interfere with. *We should indulge in the muscular and mental repose which is demanded; and this should last for not much less than an hour after every meal.* In that time, the secretion of bile is nearly finished; the new nutriment begins to tell upon the general circulation; and we are again fit for active exertion. The consequence of not observing this rule, is very hurtful. Strong exercise, or mental application, during or immediately after a meal, diverts the flow of nervous energy and of blood to the stomach, and the process of digestion is necessarily retarded or stopped. Confusion is thus introduced into the system, and a tendency to the terrible calamity of dyspepsia is perhaps established.

For the same reason that repose is required after a meal, it is necessary, in some measure, for a little while before. At the moment when we have concluded a severe muscular task, such, for example, as a long walk, the flow of nervous energy and of circulation is strongly directed to the muscular system. It requires some time to allow this flow to stop and subside; and, till this takes place, it is not proper to bring the stomach into exercise, as the demand which it makes when filled would not in that case be answered. Just so, if we be engaged in close mental application, the nervous energy and circulation being in that case directed to the brain, it is not right all at once to call another and distant organ into play; some time is required to allow of the energy and circulation being prepared to take the new direction. It may, therefore, be laid down as a maxim, that *a short period of repose, or at least of very light occupation, should be allowed before every meal.*

It is remarkable that these rules, although the natural reasons for them were not, perhaps, well known, have long been followed with regard to animals upon which man sets a value, while as yet their application to the human constitution is thought of only by a few. Those intrusted with horses and dogs will not allow them to feed immediately after exercise; nor will they allow them to be subjected to exercise for some time after feeding. Experience has also instructed veteran soldiers not to dine the instant that a long march has been concluded, but to wait coolly till ample time has been allowed for all the proper preparations.

Although strong mental and muscular exercise should be avoided before, during, and immediately after a meal, there can be no objection to the light and lively chat which generally is indulged in where several are met to eat together. On the contrary, it is believed that jocund conversation is useful towards the process of nutrition. Dr Combe, in one of his invaluable works, observes as follows:—"The necessary churning, or agitation of the food, is, from the peculiar situation of the stomach, greatly assisted by the play of the diaphragm and abdominal muscles during inspiration and
tion; and the diminution of the vivacity and e
the respiratory movement which always atte
spondency and grief, is one source of the e
digestion which notoriously accompanies depr
mind. The same cause also leads necessari
unfavourable condition of the blood itself, whi
turn weakens digestion in common with eve
function; but the muscular or mechanical influ
that which at present chiefly concerns us. On t
hand, the active and energetic respiration a
on cheerfulness and buoyancy of spirits, add
power of digestion, both by aiding the motion
stomach and by imparting to it a more richly
tuted blood. If to these causes be added the
of nervous stimulus which pleasing emotions
in the stomach (as in the muscles and organs
tion generally), we shall have no difficulty in
ing why digestion goes on so well in parties wh
is much jocularity and mirth. 'Laughter,' s
fessor Hufeland of Berlin, 'is one of the great
to digestion with which I am acquainted; and
tom prevalent among our forefathers, of exci
table by jesters and buffoons, was founded on
tally in harmony with [] true medical principl
word, endeavour to have cheerful and merry
nions at your meals: what nourishment one
amidst mirth and jollity, will certainly produ
and light blood.'"*

KINDS OF FOOD.

It has been shown, by a reference to the s
of the human intestinal canal, that our food is
to be a mixture of animal and vegetable su
There is, it is to be remarked, a power of
tion in nature, by which individuals may be
for a considerable time to live healthily on
other kind exclusively, or nearly so. This

weight of this food! Such a case is rather to b
amongst instances of extraordinary adaptations
ticular kind of food, than as a proof that an
potato diet is healthy. Climate has a remarka
in modifying the rule as to a mixture of an
vegetable food. The former has most of a sti
quality, and this quality is greater in beef, an
general, than in fowl or fish. Now, the inhab
torrid countries are in their ordinary condition
need of stimulus: hence they find a simple di
and sago sufficient for them. Those, on the
who dwell in cold countries need much stimulu
they can devour vast quantities of flesh and
with scarcely any mixture of vegetable food.

Inquiries with respect to the comparative
lity of different kinds of food, are perhaps
consequence to those in whom health has alre
lost. To the sound and healthy, it is compar
little consequence what kind of food is taken,
that some variation is observed, and no ex

burgh: 1836.

f any particular limb does little besides im-
e strength of that limb; and that, in order
our general strength, the whole frame must
into exercise. The blacksmith, by wield-
mmer, increases the muscular volume and
f his right arm only, or, if the rest of his
es any advantage from his exercise, it is
e general movement which the wielding of
occasions. One whose profession consists in
leaping, for the same reason, chiefly improves
s of his legs. The right hands of most per-
ing more frequently employed than the left,
nsibly larger as well as stronger. A still
ing illustration of the principle is to be found
nal peculiarity which has been remarked in
tants of Paris. Owing to the uneven nature
ement of that city, the people are obliged to
tripping manner on the front of their feet; a
which calls the muscles of the calves of the
trong exertion. It is accordingly remarked,
er proportion of the people of Paris are dis-
by an uncommon bulk in this part of their
an in other cities.

e, then, to maintain in a sound state the
hich nature has given us, and, still more
y, to increase their amount, *we must exercise*
we desire to have a strong limb, we must
at limb; if we desire that the whole of our
uld be sound and strong, we must exercise

stead of a gain, will be the consequence.

cise, to be efficacious even in a healthy sub-
be excited, sustained, and directed by that
imulus which gives the muscles the principal
ir strength, and contributes so much to the
of parts in a state of activity. To explain
ust be mentioned that to produce motion re-
co-operation of the muscular fibre with two
ves, one of which conveys the command of the
he muscle, and causes its contraction, while
conveys back to the brain the peculiar sense
e of the muscle, by which we judge of the fit-
e degree of contraction which has been pro-
ecomplish the end desired, and which is ob-
indispensable piece of information to the mind
ng the movements of the body. The nervous
hus created, will enable a muscle in the liv-
to bear a weight of a hundred pounds, while,
, it would be torn asunder by one of ten. It
uses men in danger, or in the pursuit of some
sired object, to perform such extraordinary
rength and activity. In order, then, to obtain
tage of this powerful agent, *we must be intel-*
what we are doing. A sport that calls up the
ergy, a walk towards a place which we are
reach, or even an exercise which we engage
h a desire of invigorating our health and

waste occasioned by exercise must be duly
y food; as, if there be any deficiency in that
requisite, the blood will soon cease to give
portion to the parts upon which increased
l strength depend.

KINDS OF BODILY EXERCISE.

is usually considered as of two kinds—active
ve. The active consists in walking, running,

interval amounts to nine hours, the lunch should be a little more substantial, but not of animal food, particularly if any has been taken at breakfast. A glass of wine is often added to a biscuit lunch, or wine alone is taken; but neither of these practices can be commended. While a small quantity of bread or biscuit gives real strength, and is quite sufficient for the occasion, wine only gives a stimulus, serving for the time, but making the case worse afterwards.

VARIETY OF FOOD.

A judicious variation of food is not only useful, but important. There are, it is true, some aliments, such as bread, which cannot be varied, and which no one ever wishes to be so. But apart from one or two articles, a certain variation or rotation is much to be desired, and will prove favourable to health. There is a common prepossession respecting *one dish*, which is more spoken of than acted upon. In reality, there is no virtue in this practice, excepting that, if rigidly adhered to, it makes excess nearly impossible, no one being able to eat to satiety of one kind of food. There would be a benefit from both a daily variation of food and eating of more than one dish at a meal, *if moderation were in both cases to be strictly observed*, for the relish to be thus obtained is useful as promotive of the flow of nervous energy to the stomach, exactly in the same manner as cheerfulness is useful. The policy which would make food in any way unpleasant to the taste, is a most mistaken one; for to eat with languor, or against inclination, or with any degree of disgust, is to lose much of the benefit of eating. On the other hand, to cook dishes highly, and provoke appetite by artificial means, are equally reprehensible. Propriety lies in the mean between the two extremes.

BEVERAGES.

The body containing a vast amount of fluids, which are undergoing a perpetual waste, there is a necessity for an occasional supply of liquor of some kind, as well as of solid food. It remains to be considered what is required in the character or nature of this liquor, to make it serve the end consistently with the preservation of health.

It is scarcely necessary to remark how men in all ages, and almost all climes, have indulged in liquors containing a large infusion of alcohol, or how widespread in our own society is the custom of drinking considerable quantities of wine, spirits, and beer, both at meals and on other occasions. Against habits so inveterate it is apt to appear like fanaticism to make any decided objection; yet the investigator of the laws which regulate health is bound to consider above all things how any particular habit bears upon the human constitution, and to state what is the result of his inquiries, however irreconcileable it may be with popular prejudice.

"The primary effect of all distilled and fermented liquors," says Dr Combe, "is to *stimulate the nervous system and quicken the circulation*." They may thus be said to have a larger measure of the effect which animal food has upon the system. It is therefore the less surprising that those tropical nations which live most on farinaceous diet, are also found to be those which have the least propensity to the drinking of ardent spirits; while those northern nations which live most on animal food, have the exactly contrary inclination with respect to liquor, the Scandinavian tribes being notoriously the greatest sots that have ever been known. Dr Combe admits that, in some conditions of the system, when the natural stimulus is defective, it may be proper to take an artificial supply in the form of ardent and fermented liquors. "There are," he says, "many constitutions so inherently defective in *energy*, as to derive benefit from a moderate daily allowance of wine; and there are many situations in which even the healthiest derive additional security from its occasional use. If, for example, a healthy person is exposed to unusual and continued exertion in the open air, or to the influence of anxious and sing watchfulness, a moderate quantity of wine food may become the means of warding off ac ease, and enabling him to bear up uninjure without it he would have given way." But Dr C the same time declares, in the most decided that, when the digestion is good and the syste vigour, the bodily energy is easily sustained tious food, and "artificial stimulant *only* ince *wasting of the natural strength*." Nearly all ph indeed, concur in representing ardent liquor favourable to the health of the healthy, and as their excess, highly injurious. Even the spe fence which has been set up for their use, on th that they would not have been given to man if not been designed for general use, has been be ill-founded, seeing that *vinous fermentati* which they are derived, is not a healthy con vegetable matter, but a stage in its progress Upon the whole, there can be little doubt t liquors are deleterious in our ordinary healt tion; and that simple water, toast water, whe beer, or lemonade, would be preferable (the f the most natural and the best of all), if we co consent to deny ourselves further indulgence.

CLEANLINESS.

To keep the body in a cleanly condition is t important requisite for health. This becom sary in consequence of a very important proce is constantly going on near and upon the surfa body.

The process in question is that of *perspirati* matter here concerned is a watery secretion by glands near the surface of the body, up through the skin by channels imperceptnute and wonderfully numerous. From one pounds of this secretion is believed to exude these channels or *pores* in the course of two hours, being in fact the chief form taken by called the waste of the system, the remainder off by the bowels, kidneys, and lungs. To pro free egress of this fluid is of great conseq health; for when it is suppressed, disease is s upon some of the other organs concerned in charge of waste.

One of the most notable checks which per experiences is that produced by a current of upon the skin, in which case the pores instatract and close, and the individual is seized wi ailment either in one of the other organs whichever is in him the weakest, or in the lining of some part of the body, all of which sthetic with the condition of the skin. A resu nature of that last described is usually recogcold or catarrh. We are not at present called ticularly to notice such effects of checked pers but others of a less immediately hurtful or d nature.

The fluid alluded to is composed, besides certain salts and animal matters, which, being not pass away in vapour, as does the watery pa compound, but rest on the surface where it been discharged. There, if not removed by ar ficial means, they form a layer of hard stuff, avoidably impede the egress of the current pers By cleanliness is merely meant the taking prop to prevent this or any other matter accumula the surface, to the production of certain hurtf quences.

Ablution or washing is the best means of attai end; and accordingly it is well for us to wash the body very frequently. Many leave by far the part of their bodies unwashed, except, perhaps, occasions, thinking it enough if the parts ex common view be in decent trim. If the object ing were solely to preserve fair appearances, th be sufficient; but the great end, a much more

xercise of any particular limb does little besides in-
ovice the strength of that limb; and that, in order
increase our general strength, the whole frame must
brought into exercise. The blacksmith, by wield-
g his hammer, increases the muscular volume and
rength of his right arm only, or, if the rest of his
dy derives any advantage from his exercise, it is
rough the general movement which the wielding of
hammer occasions. One whose profession consists in
ncing or leaping, for the same reason, chiefly improves
e muscles of his legs. The right hands of most per-
ns, by being more frequently employed than the left,
come sensibly larger as well as stronger. A still
ore striking illustration of the principle is to be found
a personal peculiarity which has been remarked in
e inhabitants of Paris. Owing to the uneven nature
the pavement of that city, the people are obliged to
lk in a tripping manner on the front of their feet; a
ovement which calls the muscles of the calves of the
gs into strong exertion. It is accordingly remarked,
at a larger proportion of the people of Paris are dis-
nguished by an uncommon bulk in this part of their
rsons, than in other cities.

In order, then, to maintain in a sound state the
ergies which nature has given us, and, still more
rticularly, to increase their amount, *we must exercise*
em. If we desire to have a strong limb, we must
ercise that limb; if we desire that the whole of our
ame should be sound and strong, we must exercise
e whole of our frame. It is mainly by these means
at health and strength are to be preserved and im-
oved. There are rules, however, for the application
these laws of our being.

1. In order that exercise may be truly advantageous,
e parts must be in a state of sufficient health to en-
ure the exertion. A system weakened by disease or
ng inaction must be exercised very sparingly, and
ought on to greater efforts very gradually; other-
se the usual effects of over-exercise will follow. In
y case must exercise be carried beyond what the parts
e capable of bearing with ease; otherwise a loss of
ergy, instead of a gain, will be the consequence.

2. Exercise, to be efficacious even in a healthy sub-
ct, must be excited, sustained, and directed by that
rvous stimulus which gives the muscles the principal
rt of their strength, and contributes so much to the
utrition of parts in a state of activity. To explain
is, it must be mentioned that to produce motion re-
uires the co-operation of the muscular fibre with two
ts of nerves, one of which conveys the command of the
ain to the muscle, and causes its contraction, while
e other conveys back to the brain the peculiar sense
the state of the muscle, by which we judge of the fit-
ss of the degree of contraction which has been pro-
ced to accomplish the end desired, and which is ob-
ously an indispensable piece of information to the mind
regulating the movements of the body. The nervous
imulus thus created, will enable a muscle in the liv-
g frame to bear a weight of a hundred pounds, while,
detached, it would be torn asunder by one of ten. It
what causes men in danger, or in the pursuit of some
gerly desired object, to perform such extraordinary
ats of strength and activity. In order, then, to obtain
e advantage of this powerful agent, *we must be inte-*
sted in what we are doing. A sport that calls up the
ental energy, a walk towards a place which we are
xious to reach, or even an exercise which we engage
through a desire of invigorating our health and
rength, will prove beneficial, when more of actual
otion, performed languidly, may be nearly ineffectual.

3. The waste occasioned by exercise must be duly
placed by food; as, if there be any deficiency in that
portant requisite, the blood will soon cease to give
at invigoration to the parts upon which increased
alth and strength depend.

KINDS OF BODILY EXERCISE.

Exercise is usually considered as of two kinds—active
nd passive. The active consists in walking, running,

leaping, riding, fencing, rowing, skating, swimming, dancing, and various exercises, such as those with the poles, ropes, &c., prescribed in gymnastic institutions. The passive consists in carriage-riding, sailing, friction, swinging, &c.

Walking is perhaps the readiest mode of taking exercise, and the one most extensively resorted to. If it brought the upper part of the body as thoroughly into exertion as the lower, it would be perfect, for it is gentle and safe with nearly all except the much debilitated. To render it the more effectual in the upper part of the body, it were well to walk at all times, when convenient, *singly*, and allow the arms and trunk free play. It is best to walk with a companion, or for some definite object, as the flow of nervous energy will be by these means promoted, and the exercise be rendered, as has been already explained, the more serviceable.

Very long or rapid walks should not be attempted by individuals of sedentary habits, nor by weakly persons. Their frames are totally unprepared for such violent exertion. When a person who has been long confined at still employments finds himself at liberty to indulge his inclination for a ramble of a few days in the country, he should begin with slow and short marches, and be content therewith till his body is hardened for greater efforts. This is a rule followed in the army with respect to regiments which are about to undertake long marches. Every summer, many youths, from ignorance, do themselves great injury by undertaking pedestrian excursions much beyond their strength. Jaded to the last degree, and incapable of enjoying any thing presented to their observation, they nevertheless persist in making out some appointed number of miles per day, never once thinking of the outrage they are committing upon themselves, and only looking to the glory of executing their task, the only pleasure they find in the journey. Serious consequences — consumption not unfrequently — follow such ill-advised efforts.

With respect to very rapid walking, Dr Johnson records some effects from it, of a remarkable nature, as occurring in his own case. "In my own person," says he, "I had some years ago a very severe and alarming instance of the bad effects of too great muscular action, occasioned by a habit of walking very fast. After a day and night of unusual fatigue and rapid pedestrian exertion, together with considerable mental anxiety, I was suddenly seized with an intermission of the pulse at irregular periods. During each intermission, I felt the heart give a kind of struggle, as it were, and strike with great violence against the ribs, accompanied by a peculiar and most distressing sensation in the cardiac region, which I cannot describe." These symptoms became aggravated, and lasted for eight weeks, "during which time," he continues, "I used horse-exercise, and kept, when at home, in a horizontal position. At length the heart gradually lost its morbid irritability; and at the end of fourteen or fifteen weeks I could walk as well as ever."

Running is an exercise which is intermediate between walking and leaping; it consists, in fact, of a series of leaps performed in progression from one foot to another, and the degree of its rapidity bears a constant proportion to the length of the individual and successive leaps. During this exercise the individual is obliged to take long inspirations, and make slow expirations; the air-cells of the lungs are thereby distended, and the action of the heart being at the same time increased, and the circulation through the lungs much accelerated, a sense of oppression is felt on the chest, which is often exceedingly painful; when the violent action is discontinued, the heart palpitates with intermitting strokes, in the endeavour to recover its natural equilibrium of motion. Although this and other gymnastic exercises, such as leaping, wrestling, throwing heavy weights, &c., may, when judiciously had recourse to, invigorate the body, yet, from apprehension of the evils and accidents which may be so occasioned, young persons ought not to be permitted to engage extensively in such exercises, except under the care of some one well

with gymnastics.

Fencing is of all active exercises that w
most commendable, inasmuch as it throw
chest, and at the same time calls into action
both of the upper and lower extremities.
that it improves very much the carriage of
for which reason it may be reckoned a bran
education. The salutary effects of the othe
which are taught in gymnastic institution
exercise with the ropes, poles, pulleys, &c.,
ing the strength of the body, will be seen
ing Mr Roland's Treatise on Gymnastics, wh
found a table showing the amount of the
growth and strength of the body in a given ti
the employment of these exercises.

Dancing is exhilarating and healthful, an
be almost the only active exercise which th
laws of fashion permit young ladies to enjoy.
scarcely consider modern quadrilles, elegan
they be, as exercise, seeing that they differ l
the most common walking movement. But
dances, reels, and hornpipes, are genuine exe

sufficient flow of the nervous energy may be o

The amount of bodily exercise which should
must vary according to the habits, strength, w
ral health of the individual. It was an aph
Boerhaave, that every person should take at l
hours' exercise in the day, and this may be reg
a good general rule.

MENTAL EXERCISE.

Having thus explained the laws and regula
which exercise may be serviceable to the phys
tem, we shall proceed to show that the same ru
good respecting the mental faculties. These
generally allowed, however immaterial in ou
are connected organically with the brain—a pa
the animal system nourished by the same blo
regulated by the same vital laws, as the muscles
and nerves. As, by disuse, muscle becomes ema
bone softens, blood-vessels are obliterated, and
lose their natural structure, so, by disuse, d
brain fall out of its proper state, and create m
its possessor; and as, by over-exertion, the w
the animal system exceeds the supply, and debil
unsoundness are produced, so, by over-exertion,
functions of the brain liable to be deranged a
stroyed. The processes are physiologically the
and the effects bear an exact relation to each
As with the bodily powers, the mental are in
creased in magnitude and energy by a degree of
cise measured with a just regard to their re
health and native or habitual energies. Correspo
moreover, to the influence which the mind has u
the nervous stimulus so useful in bodily exercise
dependence of the mind upon the body for supp
healthy nutriment. And, in like manner with the
functions, each mental faculty is only to be strengt
by the exercise of itself in particular. Every p
our intellectual and moral nature, stands, in th
spect, exactly in the same situation with the blacks
right arm and the lower limbs of the inhabita
Paris: each must be exercised for its own sake,

The fatal effects of the disuse of the mental fa
are strikingly observable in persons who have the
fortune to be solitarily confined, many of whom b
insane, or at least weak in their intellects. It i
observable in the deaf and blind, among whom
the non-employment of a number of the faculties,
ness of mind and idiocy are more prevalent than

t it ought to be. The means of obtaining plea-
ave swallowed up the end. The glorious face of
, with all its sublime and beautiful alternations;
lights of social life; the pleasures arising from

ciety.

It ought to be universally known, that the uses of our intellectual nature are not to be properly realised without a just regard to the laws of that perishable frame with which it is connected; that, in cultivating the mind, we must neither overtask nor undertask the body, neither push it to too great a speed, nor leave it neglected; and that, notwithstanding this intimate connexion and mutual dependence, the highest merits on the part of the mind will not compensate for muscles mistreated, or soothe a nervous system which severe study has tortured into insanity. To come to detail, it ought to be impressed on all, that to spend more than a moderate number of hours in mental exercise diminishes insensibly the powers of future application, and tends to abbreviate life; that no mental exercise should be attempted immediately after meals, as the processes of thought and of digestion cannot be safely prosecuted together; and that, without a due share of exercise to the whole of the mental faculties, there can be no soundness in any, while the whole corporeal system will give way beneath a severe pressure upon any one in particular. These are truths completely established with physiologists, and upon which it is undeniable that a great portion of human happiness depends.

REPOSE A CONDITION DEMANDED BY EXERCISE.

Exercise demands occasional periods of repose, and, in particular, that a certain part of every twenty-four hours be spent in sleep. After having been engaged in daily occupations for fourteen or sixteen hours, a general feeling of fatigue and weakness is induced; the motions of the body become difficult, the senses confused, the power of volition or *will* suspended, and the rest of the mental faculties, becoming more and more inactive, sink at length into a state of unconsciousness. The sense of sight first ceases to act by the closing of the eyelids; then the senses of taste and smell become dormant; and then those of hearing and touch. The muscles, also, dispose themselves with a certain reference to ease of position, those of the limbs having grown indolent before those that support the head, and those that support the head before those of the trunk. In proportion as these phenomena proceed, the respiration becomes slower and more deep, the circulation dimi-

s vessels, should not lead, if long persisted in, to
y bad consequences. Those who are compelled to
edentary, should make it their endeavour to obtain
fficiently high temperature, either by warming their
rtments sufficiently, or thickening their clothing.
mmon fires, though delightful from their cheerful
, are confessedly very inadequate, in most circum-
ces, to heat large work-rooms, school-rooms, or
n the larger class of sitting-rooms; not to speak of
great objection which has been made to them on
score of economy, three-fourths of their heat being
off through the chimney. It is most desirable that
e means in which the public could have confidence
e devised for thoroughly, and at the same time
lthily, warming large apartments. Stoves enclosed
large iron-plate cases (Arnott's stoves), pipes of
water or of steam, and blasts of heated air, are
ongst the most conspicuous plans tried within the
few years. But none of these plans seems to have
ceeded in obtaining the hearty approbation of the
blic, chiefly, we suspect, from their not being ac-
panied by what is peculiarly necessary where they
in operation, a means of ventilation. We can
ak from some experience in favour of the plan of
e steam-tubes, accompanied by a ventilating pro-
; and have very little doubt that, with the latter
nisite, this and several other of the recently sug-
ted modes of heating might be found to serve the
ired end. It is certainly of great consequence that
e plan should be generally consented upon for
ming the large rooms in which scholars and work-
ple spend so much time, as the chilliness there so
erally experienced is a fatal underminer of the
man constitution.

lothing should be in proportion to the temperature
the climate and the season of the year; and where
re are such abrupt transitions from heat to cold as
ur country, it is not safe ever to go very thinly clad,
e may in that case be exposed to a sudden chill
re we can effect the proper change of dress. Very
l effects often result to ladies from incautiously
ping out of heated rooms in the imperfect clothing
ch they ludicrously style *full-dress*: all such injuries
ht be avoided by putting on a sufficiency of shawls,
allowing themselves a little time in the lobby to cool.
under-clothing in this country should be invariably
lannel, which is remarkably well calculated to pre-
e uniformity of temperature, as well as to produce
althy irritation in the skin. While the value of
fortable clothing is fully acknowledged, we should
er lose sight of the value of exercise for keeping up
ndly glow upon the surface, and for the support of
gh tone of general health. Any one who, neglect-
this, should live constantly in a warmed apartment,
nly go out of doors muffled up in a load of clothes,
ld speedily suffer from a relaxed state of the sys-
, and become so susceptible of damage from the
litest change of temperature in the atmosphere,
the most dangerous consequences might be appre-
ded.

Wet clothes applied to any part of the body, when it
an inactive state, have an instantaneous effect in
ucing the temperature, this being an unavoidable
ct of the process of evaporation which then takes
e. Hence it is extremely dangerous to sit upon
p ground, or to remain at rest for a single minute
wetted feet, or any other part of the body invested
amp garments. Dampness in the house in which
live has the same effect, and is equally dangerous.
chill produced by the evaporation from the wetted
face, checks the perspiration, and sends the blood
ards to the vital parts, where it tends to produce
ammatory disease. Few persons seem to be aware
hese truths. We find young men heedlessly getting
r feet wet, and sitting with them in that condition,
eby incurring the most deadly peril. Young women
mit a similar folly, when they walk out in thin
es in a wet or cold day. Exposure to wet, damp, or
d, is of comparatively little moment when the body

out-of-door labourers, and also poor people in damp lodgings, than rheumatism. This is an affection produced solely by a violation of the natural law which demands that the body should not be chilled. Rheumatism is produced alike from exposure to a shower or to a draught of cold air when the body is warm, and from sitting with the feet on a cold stone or clay floor; the only difference, perhaps, being that the rheumatism is in one case in the shoulders and in the other in the legs. Let us therefore impress on all the propriety of avoiding chills, the effects of which may be much more fatal than a simple attack of rheumatism. When rheumatism has been contracted, the best remedy for its expulsion, if adopted in time, is friction of the part; if well rubbed before a fire with flour of mustard, so as to cause a counter irritation on the surface, the internal complaint may be expelled.

ERRORS IN DRESS.

This is perhaps the most appropriate place in which to introduce some remarks upon errors in dress. The integuments which nature calls upon us to put on for the sake of warmth, are too often made the means of inflicting serious injury, either through ignorance or caprice. It is therefore necessary, in a treatise on the preservation of health, to advert in emphatic terms to this subject.

It is scarcely too much to say, that there is no part of the human frame, from the sole of the foot to the crown of the head, which has not been, and is not at this moment, mistreated by fashion. We laugh at the Chinese ladies, who have their feet constrained by iron moulds into mere bulbous appendages to the limbs; but we never reflect that, amongst ourselves, errors only inferior in degree are constantly committed. The foot naturally spreads out, fan-like, from the heel to the toes. But, instead of having our shoes formed in the same triangular shape, they are made in a lozenge form, truncated at the front, the toes being thus perverted from their radiating arrangement into one exactly the opposite; so that they become crushed under one another, and deprived of a great part of that muscular power by which they were designed to propel our bodies in walking. In the greater height usually given to the heels of shoes, another important deviation from nature is committed. When the heel is raised above

There may be a general advantage ng the matter placed on something like a philo- al basis.

hysiological doctrine seems more entitled to faith gard, than that a harmonious exercise, in mode- of all parts of the system, including the organs mental faculties, is necessary for health. It is by the very craving which we experience, after task, or a long perseverance in some particular for something which will engage a different set ties. There is nothing which will pleasingly our thoughts for any considerable length of Something inferior will invariably be preferred, ly be new. Now, the duties by which men in earn their subsistence, are in all cases of such as only to call into exercise a part of their and bodily system. Something is required, at soothe and compensate us for the drudgery of rent labours, and to bring into exercise those f our muscular frame and intellect, which pro- al duty has left unoccupied. To begin with an illustration: how delightful to a tailor, after ercising his fingers and arms alone at his busi- enter into some athletic sport upon the village- by which his limbs also will be exercised! After er has fagged for a day at a brief, how delightful ible, by the reading of a new novel or play, to call other set of the intellectual powers! In these s from grave to light occupation, there is at once given to the tasked faculty, and the gratification loyment given to others which have been pining t of something to do. It so happens that, from ntient nerves being mixed with those which direct erations of all our organs, each organ has a sense joyment in being rightly exercised. Even the ch has, from this cause, a gratification when its ons are going on well, and this altogether inde- t of any pleasure we may have had in eating the upon which it is now employed. An organ left unoccupied is thus somewhat like a child in a which its parents have been overlooking.* It s to be noticed like the rest, and, when the desired at length comes, it experiences a high degree of action. In short, variation of occupation and pur-

suit, for the purpose of keeping all the parts of the system in harmonious exercise and in healthy tone, is one of the most important principles concerned in the preservation of health.

There are several powers of the mind which must have been designed for the express purpose of creating and receiving amusement, and the existence of which, therefore, shows that amusement has a place in the right economy of human life. The imitative arts in general, music, fiction, drollery of all kinds, spring directly from primitive faculties of the mind; and, when we see the pleasure they give in society, we cannot doubt that they are things naturally required by man, and in which it is quite legitimate for him to indulge within moderate bounds and in circumstances compatible with innocence. These things are doubtless designed to alleviate the burdens of life and beguile us of its cares. They furnish something like a different sphere of existence, into which we may enter and temporarily lose the sense of all that harasses us in the ordinary one. The *joculator* —under which name our ancestors associated the poet, tale-teller, and mimic, and which we may apply equally extensively to the poet, novelist, artist, and player—is therefore a most useful functionary in society. We say nothing on the present occasion of the refinement to be derived, in addition, from communion with the productions of the higher class of such minds.

Amongst amusements, *reading* takes a most distinguished place, for there is none which may be more readily or more innocently indulged in, and fortunately, in our own country, it is one which may now be enjoyed by all. It is unquestionably the chief of in-door amusements; and few scenes are calculated to awaken more agreeable feelings in a well-constituted mind, than a family group assembled in their parlour, to hear some one of their number reading a pleasant book. Ever honoured be the great masters of fiction, who have allowed us, by these means, to pass from common life, for a time, into "the tale of Troy divine," the story of "the gentle lady married to the Moor," the tear-compelling fate of Ravenswood, and all the other numberless suppositions of things done, and persons who spoke and acted, which we feel to be more real than much of even the life that is passing around us!

Next to reading stands *music*, a means of enjoyment of which only a few comparatively, in our country, take advantage, but which might easily be made much more extensively available, and probably will be so in the course of a few years. Connected intimately with music is *dancing*, which is not only a cheerful amusement, but a positive and direct means of bodily exercise. A family musical or dancing scene, like a family reading scene, is a thing beautiful to look upon. There is a prejudice against both in some minds, on account of their being liable to abuse; but the abuses of both arise very much from their not being extensively or freely indulged in. Were music the general accomplishment which it might easily be made, it would not only be indulged in on all occasions with simplicity and innocence, but it would supplant coarser and more clandestine amusements. Dancing is the nightly amusement of the French peasantry, and it has never been pretended that these people are less virtuous than the corresponding class in our own country. *Theatrical representations* it might be more difficult to place on such a footing as to secure the unhesitating approbation of the good; but certainly, if this were done, they might prove highly serviceable in furnishing amusement.

In the class of amusements we must reckon meetings or promenades in ornamental grounds, excursions into the country, and little tours, all of which are highly commendable in those who are able to indulge in them. The entertainment of little parties of friends, and the going out to entertainments given by them in return, are other means of amusement common in society, and which may be moderately indulged in with much advantage. In short, whatever gives a pleasant variation to the monotony of life, without leading the mind away from duty or corrupting the manners, ought to

be indulged in as freely as circumstances will permit. The mind returns from such diversions with renewed tone and power, and neither the time nor the expense is lost in the long run. It is the more necessary to impress these maxims, as many well-meaning persons, alarmed perhaps at the occasional abuse of such enjoyments, repudiate them nearly altogether, and thereby lower the tone of their health, both as respects the body and the mind. It is particularly distressing to see such persons exercising a control over the young, and denying to their unfortunate protegés an element of life not much less pressingly necessary than the air they breathe.

Dr Southwood Smith, in his excellent work "The Philosophy of Health," has pointed out that pleasure is the ordinary, and pain in all cases an extraordinary, result of the action of our organs. "There are," he says, "many cases in which pleasure is manifestly given for its own sake; but in no case is the excitement of pain gratuitous." Pain is always a punishment; and, when it reaches a certain extreme, it is destructive of what feels it. But "all such action of the organs as is productive of pleasure is conducive to the perpetuation of life. There is a close connexion between happiness and longevity. Enjoyment is not only the end of life, but it is the only condition of life which is compatible with a protracted term of existence. The happier a human being is, the longer he lives; the more he suffers, the sooner he dies: to add to enjoyment is to lengthen life; to inflict pain is to shorten the duration of existence." It may fairly be presumed, then, that a certain amount of enjoyment in life is necessary for health, and that when the quantity actually secured is much below that point, unhealthy conditions must ensue. If, for example, poverty or embarrassed circumstances press so severely upon a cautious and conscientious man, as to leave him scarcely a moment's comfort from one year to another, he cannot fail to sink in health. If married to a female of bad temper, or who afflicts him by bad habits, and if, from these causes, he rarely enjoys a moment of happiness, so also must his health fail. In short, to be placed in any such circumstances as constitute a bar against nearly all enjoyments, must prove injurious, and tend to the shortening of life.

Enjoyments are of many kinds. Some are sensual, as the taking of agreeable food; others are intellectual, as agreeable music, reading, &c.; others are moral, as the exercise of philanthropy, the religious feelings, &c.; and some are sympathetic, and consist in the exercise of the affections and the reflection of that gratification which we have endeavoured to impart to others. We may consider as such all things over and above the plainest unrelished fare, and the supply of water, air, and a barely sufficient temperature. These are usually considered as strictly the *necessaries* of life, the others being the comforts or luxuries. The distinction is not quite correct. The first class are certainly immediately necessary to the support of life; that is to say, they are hourly, daily necessary. But more or less of what are called the comforts of life are also necessary, if we would preserve health. The only difference is, that the want of them would not tell in so short a time as the want of the so-called necessaries. If a human being be shut up in a cell, and allowed only a sufficiency of unrelished and unvaried food, with air and water, the want of all the enjoyments of life, sensual, intellectual, moral, and sympathetic, will in a certain time make him utterly miserable; the health of body and mind will give way; and if the experiment be sufficiently protracted, he will perish. The ignorance which prevails on this point has led to the trial of what is called the *silent system* in prisons, which is now about to be abandoned as utterly irreconcileable with humanity. It were well if more knowledge prevailed on the subject, for, from erroneous ideas of what is *necessary* for healthy life, many deprive themselves or others of things which, when we take the element of time into account, are as essential to health as the supply of the air we breathe. There is, in some enthusiastic minds, a spirit of asceticism and self-mortification which would give up all the enjoyments together. Such persons rarely fail to reduce health, if they do not also exercise some unhealthy control to the same effect over their fellows. While self-denial for moral purposes is always admirable, and over-indulgence of every kind saps the energy and fortitude of the human character, it should be kept in view that there is great danger in reducing allowance of comforts and indulgences too low. Too rigid views of what is necessary for the support usually prevail, wherever the affluent have to frame a style of living for the poor. The tendency is to reduce allowances as nearly as possible to what may be called the *immediate necessaries*; for it does not seem just or right that paupers, adults or children, should enjoy any species of gratification. But these are short-sighted views. The health of these unfortunate persons requires something more, and this something would be granted by an enlightened humanity. We have a strong manifestation of this need in the eagerness with which paupers generally desire a small allowance of tea or tobacco, or indeed the least variation in their diet. The craving for these luxuries is not to be met by what it is generally thought solely to be, the force of bad habits long indulged in, as it is the expression of a want in the personal economy—a want which, by some means or another, must be supplied, or injurious consequences will ensue.

EXEMPTION FROM HARASSING CARES.

It is little more than a repetition of doctrine already laid down, that, for health, a human being requires exemption from acute distress of mind and from harassing cares.

Mental distress and anxiety operate through the brain upon the condition of the whole body, and when long protracted, effectually undermine the health. "It is impossible," says Dr S. Smith, "to maintain the physical processes in a natural and vigorous condition while the mind be in a state of suffering. Every one must have observed the altered appearance of persons who have sustained calamity. A misfortune, that struck to the heart, happened to a person a year ago: observed him some time afterwards—he is wasted, worn, the miserable shadow of himself; inquire about him at the distance of a few months—he is no more." Dr Smith's opinion that the nearest cause of many deaths is not strictly a desire to escape from a state of misery, but some disease, probably inflammation of the brain, brought on by distress of mind. "By a certain quantity and intensity of misery, life may be suddenly destroyed; by a smaller amount and intensity, it may be slowly worn out and exhausted. The state of the mind affects the physical condition; the continuance of life is dependent on the physical condition; it follows that the degree in which the state of the mind is capable of affecting the physical condition, it is capable of affecting the duration of life."

Depression of mind, besides its immediate effect on the nervous system, deranges the respiration and the proper oxygenation and circulation of the blood. A diminished vitality is the consequence, often leading to pulmonary consumption. An excessive degree of fear and alarm of the selfish feelings, such as takes possession of some minds on the approach of an epidemic, also affects the whole system in such a way as—to use an expressive phrase of Dr Combe—"places it on the brink of disease," and hence the notoriously great liability of persons in this state of alarm and apprehension to fall victims to the malady when it comes. It has been remarked that an army in a high state of confidence and cheerfulness after a victory, has a much smaller proportion of sick than in the opposite circumstances, or even in its ordinary condition. The usual proportion of sick in a garrison quartered, during peace, in a healthy country, is five per cent.; during a campaign, when there is more anxiety of mind, it is ten; in the event of a defeat, although the circumstances be otherwise not unfavourable, the proportion rises to a much higher amount

ery instructive fact, that in a large detachment of French army cantoned in Bavaria immediately the battle of Austerlitz, the proportion of sick ittle more than *one* per cent.

GENERAL OBSERVATIONS.

e fundamental principle of all efforts to improve preserve health has been thus stated:—"Man, as ganised being, is subject to organic laws, as much e inanimate bodies which surround him are to mechanical and chemical; and we can as little e the consequences of neglect or violation of those al laws, which affect organic life through the air reathe, the food we eat, and the exercise we take, stone projected from the hand, or a shot from the h of a cannon, can place itself beyond the bounds avitation." It may be added, that "all human ce, all the arts of civilised man, consist of disco- s made by us of the laws impressed upon nature e Author of the universe, and the applications of laws to the conditions—which are laws also—in h man and the particular bodies and substances nd him, are placed; nor, it is manifest, should any ce concern us more than that which relates to the itions on which organic life is held by each indi- al."

e preceding sections are but explanations, such have been able to afford, of the conditions under h the organic frame of man exists, and the agen- internal and external, which operate upon it, for maintenance of health or the introduction of dis- . It must be evident, where there is a conviction e truth of the fundamental doctrine, that indivi- and societies have their health very much at their disposal; that a careful avoidance, on the one , of what is noxious, and a judicious attention to t is beneficial, are what are chiefly necessary for the ervation of the human frame in health to old age; that premature deaths, over and above those which t from unforeseen casualties, instead of being, as osed by the untutored mind, a mysterious and ersible decree of Providence, are simply the na- l effect of our own violation of laws which Provi- e has appointed for our welfare. It might still bjected that human nature is such, that the due lience and observance of those natural ordinances not to be expected; so that the vast quantity of dis- and the great number of premature deaths, which t our present state of being, are equally to be re- ed as things immutable, and therefore to be tran- ly submitted to. But this view would be not less istaken one; for there is no fact more clearly ascer- ed, than that disease and premature death are not, never have been, fixed at any given amount, but d constantly to the power of any new conditions ch man may be able to introduce. Regarding clear s on this subject as of great importance, we shall e enter a little into detail.

The object is, we apprehend, to show that sickness mortality vary both in place and in time, according hysical and organic conditions.

nquiries into these subjects were not made in ient times; but, during the last two hundred years, h facts have been recorded as enable us to ascertain , in that space of time, with regard to nearly the le of Europe, there has been a gradual improve- t in health and life, in proportion to improved con- ons. In Sweden, for instance, between 1756 and , the annual mortality was, for males, 1 in 33¼; females, 1 in 35⅔; whereas, in the year 1800, it had inished to 1 in 34¾ for males, and 1 in 37½ for ales. From mortuary tables preserved with con- rable accuracy at Geneva, it appears that, at the of the Reformation, one-half of the children born within the sixth year; in the seventeenth century, until the twelfth year; in the eighteenth century, until the twenty-seventh year; consequently, in the e of about three centuries, the probability that a child born in Geneva would arrive at maturity has increased fivefold. In London, in the year 1606, the annual deaths were 1 in 14½, or 7 per cent. of the population; and in plague years during that century, it reached 25 in 100, or every fourth man, woman, and child! *In* 1838, *it was only* 1 *in* 35½. Knowing that, at the former period, the city was dense and ill-cleaned, and that the habits of the people were not then what they are now, we cannot doubt that this diminution of mortality to less than one-half is owing to the improved conditions in which human beings now live in the metropolis. Between the years 1730 and 1750, 74 of every 100 children born in London, died before they were six years of age; but in more recent times, only 31 and a fraction out of every 100 die under the same age; that is to say, the deaths of children in London were then more than twice as numerous as they are now. About a century ago, the mortality of the children received into the London hospitals was of astonishing amount. Though the fact seems scarcely credible, we believe there is no good reason to doubt, that, of the 2800 annually received, 2690, or *twenty-three in every twenty-four*, died before they were a year old. It was at length seen that this mortality was the effect of over-crowding, impure air, and imperfect aliment; and, after an act of parliament had been procured to compel the officers to send the infants to nurse in the country, only 450 out of 2800 died in the first year. It has been ascertained that, during the last century, about a third has been added to the average expectation of life; that is to say, an individual now has as good a chance of living forty years, as he had a hundred years ago of living thirty. To what can such a fact be owing but to the diminution of the causes of disease in the improved conditions of the people?

The facts ascertained with regard to differences of mortality in different places are equally striking. A remarkable instance of the effect of marshes upon health is cited by M. Villermé. Formerly the district of Vareggio in Tuscany was in this condition, and its few miserable inhabitants were every year visited by severe agues. In 1741, floodgates were erected to keep out the sea, the marsh was dried up, and ague appeared no more. Vareggio subsequently became a populous and healthy district. The Isle of Ely is a marshy district in the east of England, and it was ascertained that, of 10,000 deaths which occurred in it between the years 1813 and 1830, no fewer than 4732 were of children under ten years of age; the proportion of deaths of children under ten in all the other agricultural districts of England being only 3505, or as about 3 to 4 of the former number. Of 10,000 deaths between ten years and extreme old age, in the same period, there were, of persons between ten and forty, 3712 in the Isle of Ely, and only 3142 in drier districts. There are some remarkable discrepancies of mortality in different counties of England. While the proportion of annual deaths in every hundred persons under six years of age is, for the whole of England and Wales, about five and a third, the proportion in Suffolk is three and a half, in Warwick six, in Middlesex eight and a third. Suffolk is an agricultural county; Warwick contains Birmingham and some other large towns; and the metropolis is situated in Middlesex: can we resist concluding that the pure air and constant exercise which children obtain in the country are the immediate means of prolonging their lives; while the narrow accommodations, impure air, and limited exercise, to be had in large towns, have exactly the contrary effect? In the general population of England, 443 in 1000 die under ten years of age; but in Manchester and Salford the number is a third larger, or 602. Here, the miserable circumstances of many of the humbler classes in Manchester—above eighteen thousand of them, for one thing, living *in cellars*—must be considered as the immediate cause of the disproportioned mortality. While the general mortality of London is, as stated, 1 annually in 35½, there are great differences with respect to different districts. In Camberwell, an open suburban district, it is

was, respectively, as we go from the roomiest to the closest, 131, 161, and 349. The proportion of sickness and mortality which the poor suffer in comparison with the rich, is thus placed in a striking point of view. Precisely similar results have been discovered in Paris. M. Villermé has there ascertained, that the deaths in some poor arrondissements are just double what they are in the rich. He states that, taking the whole of the French population, human life is protracted twelve and a half years among the wealthy beyond its duration among the poor; consequently, in the one class, a child, newly born, has a probability of living forty-two and a half years; in the other, only thirty years.

Taking the whole of the above facts into account, we must see that not only do health and longevity depend expressly on laws, the operation of which we can understand, but man has it in his power to modify to a great extent the circumstances in which he lives, with a view to the promotion of his organic well-being and preservation. We see that the draining of a marsh banishes the ague, that a change from city to country air diminishes mortality, and that the greater comforts possessed by the affluent secure them longer life than the poor. It may not immediately be in the power of every one to change his circumstances from the unhealthy to the healthy; but it is a great matter to know that the object is within human power, for then at least an encouragement is held out to induce each individual to make every possible effort to put himself, and to contribute to putting society, into more salubrious conditions.

The object may be said to depend partly upon individual and partly upon social efforts. Every person has some control over the quantity and quality of the food he eats, the condition of the air he breathes, and the exercise, repose, and recreation which are demanded by his muscular and nervous system, according to the principles laid down in this and similar treatises; as also some power to refrain from injurious excesses, and to avoid the various external agencies of a detrimental kind, which constantly beset him. Let him act as he ought to do in these respects, and he will reap an immediate reward in that pleasurable state of consciousness which attends a healthy condition. But some of the most important requisites for health depend on public measures. The amount of the necessaries was stagnant; large open ditches liquid filth; houses dirty beyond de washed or swept, and extremely bitants; heaps of refuse and rub animal remains, at the bottom of corners." [The amount of noxic hoarded or allowed to rest in Le what most of its inhabitants have as is the case with most other c solely affecting the poor.] In Mar sons, or one-twelfth of the whole live beneath the level of the ground, of both light and air. In that to labourers are often built in close back to back, so as to prevent ve are far from sufficient, and there is free space in which the people ca recreation. In Liverpool, 39,000 pe dark, damp, confined, ill-ventilated, next above, to the number of 80 built around small courts, closely p with only one entrance to each, and for refuse in the centre; an arr pears as if it had been expressl health low and mortality high. style of building obtains, with a sim stances, "no effective drainage, i of paving or cleansing." COMMERCE—MONEY—BANKS.

COMMERCE.

has been defined by some naturalists as an *exchanging animal*—an animal who buys and sells, that a thing performed by no other living creature, herefore suitable as a distinction in character, t others, much more exalted, might readily be The practice of exchanging one commodity for er is doubtless coeval with the first herding of ind together. No man, even in the rudest savage and who lives in the society of neighbours, can atisfied with such objects as he can procure or by his own labour. He must depend on others istance, while he assists them in return. The ator of the ground would exchange some of its e for an animal from the flocks of his neighbour; oth would be glad to give a portion of their wealth n clothing or weapons made by a third party. *exchanging* becomes a matter of convenience n two parties, each of whom is anxious to obtain e of the other's goods for a share of his own, and tual advantage is the result. Such desires and es must have been displayed in the very earliest s of society. No nation of African or Indian es is ever found without a strong inclination to nge the rude products of their country for the s possessed by the traveller; an ox or sheep perhaps eagerly offered by them for a single e, a nail, or a small toy looking-glass.

mankind advance in their social condition, the ge of exchanging increases; the desires and necesbecome more urgent; each person finds it more able and agreeable to adopt and hold by one fixed yment, and to sell the produce of his labour for ety of articles made by others, than to attempt to every thing for himself; and, finally, for the of convenience, a class of persons are engaged to t the exchanges from one hand to another. In mproved condition, the production of articles of al consumption is called *manufacturing*; while department of industry in which the exchanging ansacted is called *trade* or *commerce*. For still er convenience, the business of exchanging is itted to several orders of traders—the wholesale hants, who in the first instance purchase large tities of goods from the producers; the retail rs, who have been supplied in smaller quantities the merchants, and sell individual articles or le portions to the public; and to these sometimes ntermediate dealer is added. In this manner the ler from the workshop of the manufacturer to the e of the actual consumer is interrupted by several ct processes of exchange, in which each seller s a certain profit at the expense of the person has ultimately to buy and use the article. It is a iple of trade, that the fewer hands through which any article is made to pass, the better for the consumer, because the article can be brought with the least burden of profits, or at the lowest price, into general use. But this principle, sound as it is in the abstract, is counteracted by another which must on no account be lost sight of. This is the principle of *convenience*. A manufacturer engaged deeply in his own pursuits finds it more profitable and agreeable to sell his articles in large than small quantities. The maker of millions of yards of cloth has no time to spend in selling single yards. If he were compelled to sell by retail, he would have no time to conduct his affairs; he could manufacture only a small quantity, and, therefore, being limited in his amount of produce and sales, he must take larger profits. Thus, upon the whole, it is much better for all concerned to allow the manufacturer to pursue his own way in selling only very large quantities to wholesale merchants. To these traders the same rule may be applied. They seek out the seats of manufacture; and, purchasing a large variety of goods, they send them to the towns and places where they are required by the public, and there the articles can be had individually from a shop. It is evident that if any man wish to buy a handkerchief, he may procure it much more cheaply from any shop in which such things are sold at an advance upon the original cost, than if he were to travel perhaps hundreds of miles to the house of the manufacturer, and there make the purchase. The use of an intermediate class to conduct exchanges is thus very conspicuous; and any attempt to revert, generally, to the original practice of causing the maker to deal with the consumer, would be entirely incompatible with an enlarged system of trade between different countries, or even between different places in the same country. We say generally, because there are instances in which makers may, with advantage to themselves and the community, sell their produce in small quantities or single articles to the public; but these are exceptions to a common rule.

Convenience, it is evident, forms a guiding principle of trade, and requires the same consideration as the actual value of an article. This, however, has been recognised only in very recent times. At one period there were laws to prevent farmers from selling their grain in a large quantity or by the lump, without exposing it in an open market. Such laws were manifestly unjust. They interfered with the liberty of the farmer, who in his capacity of manufacturer had surely a right to sell his produce in whichever way he felt it to be most for his advantage. It would be the same kind of injustice, if the law were to prevent a manufacturer of handkerchiefs from selling them at his own workshop to wholesale dealers, and causing him to take them many miles to a certain street in a certain town, and there expose them for sale in small lots to the public. It is of the greatest importance in matters of trade and com-

Africa and Europe. Unfortunately, the intelligence which was so disseminated was afterwards obliterated by the overruling powers of barbarous and warlike nations; but the efficacy of commerce in modern times is likely to be permanent wherever its influence is extended, seeing that the greatest manufacturing and mercantile people are at the same time the most powerful and most capable of offering protection to those who sustain a commercial intercourse with them. It is exceedingly pleasing thus to reflect on what commerce is capable of effecting, independent of the actual comfort which it produces, wherever it is fairly introduced. By its appeals to the selfishness, the vanity, and other passions, good and bad, of mankind, it appears to be the best of all forerunners to the efforts of the schoolmaster and the missionary. Its influence in this respect has been remarkably exemplified in the boundless regions of Hindostan, which, by the efforts of a company of merchants, have been laid open to the settlement of enlightened men from Europe, who, though by slow degrees, will ultimately spread the blessings of education, and the decencies of social life, among many millions of human beings. In the remote islands in the Pacific Ocean, the influence of commerce has been recently of marked utility. The introduction of articles of a fanciful nature, both for the ornamenting and covering of the person, has induced a desire of following European manners and customs; and as these commodities cannot be procured but by the exchange of native commodities, a spirit of industry has consequently been produced, which cannot fail to be of both moral and physical advantage to the natives. It is always thus with the intercourse which commerce necessarily involves. New tastes are created, and to be gratified, industry must be exerted. But to witness the extraordinary influence of commerce in producing civilised and refined habits, we need not look beyond our own country. Commerce, in this its chosen seat, has caused roads every where to be cut, canals to be opened, railways to be formed, expeditious modes of travelling by sea and land to be effected; all of which great accessories to our comfort have tended in the most wonderful manner to introduce not only useful commodities and personal luxuries, but highly cultivated sentiments, literature, and the arts, into districts which at no distant period lay in a comparatively primitive condition

a said, that 'when we drink beer and porter we me the produce of English industry, whereas, n we drink port or claret we consume the produce he industry of the Portuguese and French, to the ous advantage of the latter, and the prejudice of countrymen!' But how paradoxical soever the as-ion may at first sight appear, there is not at bottom real distinction between the two cases. What is at induces foreigners to supply us with port and et? The answer is obvious:—We either send di-y to Portugal and France *an equivalent in British* ece, or we send such equivalent, in the first place, uth America for bullion, and then send that bullion e Continent to pay for the wine. And hence it is as as the sun at noonday, that the Englishman who s only French wine, who eats only bread made lish wheat, and who wears only Saxon cloth, gives, occasioning the exportation of a corresponding nt of British cotton, hardware, leather, or other ce, the same encouragement to the industry of his rymen, that he would were he to consume nothing immediately produced at home. A quantity of wine and a quantity of Birmingham goods are ctively of the same value; so that, whether we ly consume the hardware, or having exchanged it he wine, consume the latter, in so far as the em-ent of British labour is concerned, it is altogether ferent."*

om these explanations, it will be observed that it material what is given in exchange for imported —whether money or native produce. At the same it must be understood that if money is given, must exist some active industry in the country hich the money is realised. As a general question mmerce, it is of no consequence what is the nature e industry by which the money is produced. It consist in the raising of superabundant crops, or raw produce for exportation, or of manufacturing and comparatively valueless materials into articles lue and demand, or of carrying goods from one try to another. Unless a country possess one or of these branches of industry, it is without the s of paying for imported articles, and must retire the field of general commerce. England is not of ciently large dimensions to export superabundant of grain, but it possesses in an extraordinary e the means of manufacturing mineral and other tances into articles for exchange, and it derives no siderable profit from the carrying of commodities. manufactured goods, therefore, pay for imports of ign articles, including bullion or the raw material oney, and these again, in a manufactured state, are ed for the payment of still further imports. Thus wealth of our country has increased.

PRINCIPLES OF COMMERCE.

he practice of commerce is in a great measure de-dent on mutual good faith, and the integrity of seller buyer, and can in no case permanently flourish re these fundamental qualities are wanting. The or great leading quality, therefore, in the charac-of a merchant, ought to be scrupulous honesty both word and deed. The article which he proposes to ose of must be exactly what he declares it to be, inferior or in any respect unsound in its nature. If ossess any blemishes, these must be announced to buyer before the bargain is concluded, and, if neces-, though at a considerable loss, an allowance made them. The merchant is not less called on to be hful in the fulfilment of all promises which he may e, whether with respect to goods or their payment; ause those to whom the promises have been made y on that account have made similar promises to ers, and, therefore, the breaking of a single pro-e may prove injurious in every link of a whole train transactions. Perfect honesty or integrity is a fun-mental principle of trade; and the next most import-ant are, strict regularity in all proceedings, according to established usage, and also steady perseverance. The merchant must give regular attendance during the hours of business, be regular in executing all orders and answering all letters; regular in the keeping of his books, and in the reckoning of his stock and moneys; in short, he must be methodic and careful in all branches of his concerns, for without this species of attention, the best business is apt to become confused, and to be ultimately ruined. What is true of individuals is true when applied to a whole nation. No people have ever attained opulence and high mercantile consideration, who have not possessed a character for integrity and regularity in all their dealings.

Besides these indispensable qualities in the individual character of a merchant or tradesman, there is required a happy combination of enterprise and prudence with the utmost coolness—enterprise to embrace favourable opportunities of buying and selling, and prudence and coolness to restrain from engaging in over-hazardous and ruinous speculations. In all his transactions, the man of business is understood to proceed upon a cool inflexible principle of doing that which is most advantageous for himself, without fear or favour; because in commerce each party is supposed to be governed by motives of self-interest (always within the rules of honesty and propriety), and is under no obligation to deal from mere personal regard, or any kind of friendly consideration. In commerce there is, strictly speaking, no friendship. If there be friendship among the parties concerned, it is a thing aloof from business transactions—a matter of private arrangement—and is only to be regarded as such. On this account, even among the most intimate friends, there must be an exact mode of dealing, and the most accurate counting and reckoning.

The British, for several centuries, seem to have been endowed, above all other nations, with those qualities of mind which are suitable for the conducting of commerce on an enlarged and liberal scale. Their integrity, persevering industry, enterprise, prudence, and liberality of sentiment, have never been excelled. In patient industry they have been rivalled by the Dutch; but in point of enterprise and liberality, that people have fallen far short of them, and their trade has languished accordingly. The British are pre-eminently a commercial as well as a manufacturing people. Taking them generally, they possess a spirit of restless industry, which renders them actually unhappy unless when busily engaged in some pursuit calculated to enrich them, or at least to produce for their families the means of a respectable subsistence. The Americans, who are but a branch of the same British stock, are equally, if not more, remarkable for this fervent spirit of industry; and, though only set up as a separate nation within a period of sixty years, and less distinguished for their integrity and prudence than the English, have already distanced many of those dignified European principalities and powers which first discovered and colonised their country. The French, the Germans, the Spaniards, the Portuguese, the Italians, and others, though each possessing a larger or smaller extent of manufactures and commerce, are obviously deficient, in a national sense, of the eager spirit of industry which is so characteristic of the people of Great Britain. Taken in the gross, they are too apt to addict themselves to amusement in preference to business. They delight in holidays, and will at any time leave their work to mingle in a dance or some kind of buffoonery, in which an Englishman would be ashamed to appear. Scarcely one of the continental nations, moreover, has yet settled down under a well-conducted government appointed by the people. There indeed seems to be little which is settled amongst them. Some of the principal are yet at that stage of social life which was common in England about the reign of Henry VII.; others are not farther advanced than a period considerably earlier; and all have yet a great deal to suffer and to learn before they attain that state of quietude and security to

* Dictionary of Commerce.

dead. In such a case, the business has passed into the hands of new proprietors, who, though legally responsible for its obligations, are not for some private reason inclined to change the old and well-known title of their firm. A particular firm or business-concern is sometimes personified in the term *house*—as, Such a house does a great deal of business, &c.

Company.—Two or more individuals engaged in one business constitute a company or copartnery, each individual being called a partner. Companies are of two kinds, private and public. A private company is organised by a private arrangement among the parties, each having certain duties to perform and a certain share in the concern. In companies of the private and common description, no individual can leave the concern at his own pleasure, for by doing so he might seriously injure or embarrass his partners. He can withdraw only after giving a reasonable warning, by which time is allowed to wind up the concern, or place it in a condition to pay him back the capital which he has risked, or the profits which are his due. No partner, however, can transfer his share to another person, by which a new member would be introduced into the firm, without the consent of the partners.

The profits of partnerships are divided according to a specified agreement or deed of copartnery. Generally, in the case of partnerships of two or three persons, each receives the same share on the occasion of an annual division, but in other cases, a partner may not be entitled to more than a fourth or sixth part of what another receives. The amount of capital which a partner invests in the concern, the service he can be to the business, and other circumstances, regulate the amount of his share. When each of two persons sinks the same capital, but one takes the whole of the trouble, then he on whom the trouble falls, who is called the active partner, is entitled to receive a stated sum in the form of salary over and above his share of profits. Whatever be the share which individual partners have in a concern, the whole are equally liable for the debts incurred by the company, because the public give credit only on the faith that the company generally is responsible. He who draws the smallest fraction of profit, failing the others, may be compelled to pay the whole debts. On this account, every partner on leaving a company should be careful to advertise in the Gazette

y-ledger, &c. The art of book-keeping is simple.
quires only a competent knowledge of arithmetic,
ill in penmanship, with a little training in the
d of entering and posting accounts. The strictest
and accuracy are desirable. It is an understood
that no book should show a blot or erasure; a
also, should never on any account be torn out,
ver blotch or error it contains. The reason for
rupulous care is, that a merchant's books should
lear and faithful mirror of his transactions, and
idence of his integrity. In the case of misfor-
n trade, or other circumstance, the books may be
ted to a rigid judicial examination, and the ap-
hce of an erasure or torn-out leaf may lead to con-
es of an unpleasant nature and consequences.
an important error occurs in book-keeping, it is
to let it remain and write *error* below it, than to
a large erasure or to cut out the leaf.
m the books kept by a merchant, a condensed
of his affairs ought to be annually made up. This
ent contains an *inventory* or list of goods, money
owing to the merchant, or other available pro-
; also a contra list of all debts and other obliga-
due by the merchant. Both being balanced, the
e, whether for or against the merchant, is at once
vable. Every man in trade, for at least his own
action and government, should make up a *balance*
of this nature annually.
of Parcels.—An account or list of items of goods,
to their purchaser by the seller, or delivered
with the goods at the purchaser's house. Should
rchaser dispute the delivery of the goods, it is
sary to produce proof of the fact; when delivered
riers, a receipt is usually given by subscribing a
l-book.

ning, are considered to be "the act of God," or such as no human precaution could have averted, and no fraudulent intention could have produced.

Bill of Lading.—A formal acknowledgment or receipt given by sailing masters for goods put on board their vessels, including a promise to deliver them safely as marked and addressed to their designed destination, always, however, excepting loss or injury by the act of God, the king's enemies, fire, or the dangers or accidents of the sea. This bill of lading is usually a printed form, filled up with writing, and concludes with the quaint and pious wish—"And so God send the good ship to her destined port in safety: Amen." A set of two bills of lading is furnished to the shipper of the goods, one of which he retains for his own satisfaction, and the other is forwarded by post, like an invoice, to the person to whom the goods are sent. When the ship arrives at its destined port, this document can be employed to cause the captain of the vessel to deliver the goods therein mentioned.

Debenture.—This is the name of a formal certificate employed to recover a certain amount of drawback of duties from the customhouse on goods exported. The exporter draws up and signs the certificate, the signature being attested by a magistrate; and being forwarded to the customhouse, it is compared with the return of the officer who has seen the goods packed and sealed. After a certain period has elapsed, the duties are paid to the exporter. The meaning of this transaction is, that on exporting goods, any king's duty that may have been imposed upon them is paid back to the exporter, so as to relieve the foreign or colonial receiver from the burden of using taxed commodities. It also acts as a bounty on exportation.

Customs—Excise.—The duties or taxes imposed upon goods entering or going out of the country are called *customs*, and those imposed upon goods at the period of their manufacture in the country, are called *excise duties*. Both form a prime element in the national revenue, and are levied by boards of customs and excise, each having an extensive ramification of subordinate functionaries, for the imposition and collection of the duties. A customhouse is established at every principal port. Nearly all customs and excise duties must be paid at the time the goods are passed through the hands of the officers of either department, and fall in the first instance on the merchant and manufacturer. They, however, enhance the price of the commodities, and are therefore ultimately paid by the consumer. For the accommodation of merchants, the customhouses in the different chief ports possess large warehouses or depôts for goods, called *bonded warehouses*. Goods subject to duty, may, on importation, be consigned to these depôts, where they are allowed to remain till the merchant finds it convenient to remove them and pay the accustomed duties. Until removed, therefore, the commodities in bond can hardly be said to be imported into the country, being in the condition of goods still lying in a foreign port.

Lloyd's.—Lloyd is not the designation of any individual or of any company; it is a name used in reference to a set of subscription rooms, or coffee-house, in London. Formerly, the place of resort was in the Royal Exchange, but since the destruction of that building by fire, the place of meeting is in the neighbourhood of that locality. One of the rooms at Lloyd's is devoted to subscribers who follow the profession of marine insurers, technically called *underwriters*, from their writing under, or subscribing to, certain obligations in deeds presented for their acceptance. When a person wishes to insure a ship, or goods in a ship, against damage or loss at sea, he offers the risk to these underwriters, and they are at liberty to accept it for a specified premium. The policy or deed expressive of the insurance is usually signed by more than one underwriter, so as to divide the risk. Lloyd's is not only the point in the metropolis for all sea insurance business, but is the place to which every species of intelligence respecting shipping is forwarded from all parts of the world; and this information is published daily in one of the rooms, for the inspection of merchants and shippers of goods all over the kingdom. The intelligence is for the most part sent by their agents, one part of whose duty consists in investigating the cause of damage to vessels, and taking charge of wrecked property for behoof of the underwriters, whoever they may be. The lists made up and published at Lloyd's, furnish authentic information for the use of merchants and shippers of goods all over the kingdom.

Vendue.—This is a colonial phrase, used to denote a *public auction*. To sell goods at vendue is to sell them by auction. The place of sale is also called "the Vendue."

Dutch Auction.—In common auction, the highest bidder by competition is the purchaser; but according to the process of sale called Dutch auction, which is a different mode of determining the successful bidder. According to this plan, the article is put up at a certain nominal price, which is gradually lowered until the first who speaks and offers the sum mentioned by the auctioneer is at once knocked down as the purchaser. This is the fairest mode of auctioneering; it admits of competition, and the article brings its exact value, or that which it is worth in the estimation of those present.

Official and declared Value.—All goods exported are entered in the customhouse books as of so much *official value*. This value is quite illusive as regards the real value of the articles. The official value is fixed according to an estimate of the date 1694, without reference to the alteration of prices since that time. Knowing the fixed official price, we may be able to estimate the exact quantities, but this is a matter which few private individuals understand. The declared value is the price announced by the exporters of the goods, and amounts to nothing more than a rough estimate, it being necessary only to declare the value as something near the reality, for purposes of taxation in making up reports of the export trade.

Insolvency, Bankruptcy.—When a person in circumstances to pay his debts in full, he is insolvent, which is nearly equivalent to being bankrupt: a bankrupt, however, is more commonly applied to one who is legally announced or gazetted as being insolvent. The term bankrupt is derived from *bonus* good, and *ruptus* broken, in allusion to the benches or counters used by the money-dealers in Italy, which were broken in case of their failure to pay their debts. The law prescribes a certain form of procedure in the case of commercial insolvency, which has the effect of delivering investigating the cause of the misfortune, and releasing the bankrupt from all obligations, on yielding up his entire property. Only persons in trade are entitled to the benefit of this bankrupt law, all others being excluded; so that, in the event of their insolvency, they must submit to the common laws respecting debt, which are in some respects very rigorous. A bankrupt who has received a discharge or certificate from a competent authority, being released from all former claims, may again enter business for his own behoof without any fear of molestation; but a debtor who has merely taken the benefit of the Insolvent Act, or the land, or process of *Cessio Bonorum* in Scotland, is immediately relieved from prison and left at liberty to pursue any line of industry, the property he may accumulate is at all times liable to seizure by his former creditors.

A commission of bankruptcy in Scotland is called a *sequestration*, meaning that the property of the bankrupt is officially sequestered, or taken possession of, for behoof of creditors.

BRITISH COMMERCE.

British commerce is in two distinct branches, that which takes place within the country, or *home trade*, and *import*, or that which pertains to foreign nations. The inland trade conducted for home consumption is at least ten times the amount of the foreign trade. It is calculated that commodities are produced

ually to the value of *five hundred mil-*

Linen yarn, - - -	836,163	814,607
Metals, viz. iron and steel,	2,635,692	2,702,738
copper and brass,	1,221,732	1,293,977
lead, - -	154,126	195,640
tin, in bars, &c.,	101,846	112,620
tin plates, -	436,577	345,442
Salt, - - - - - -	223,456	219,069
Silk manufactures, - -	777,280	865,768
Sugar, refined, - - -	553,247	213,738
Wool, sheep or lambs', -	434,006	361,829
Woollen yarn, - - -	384,535	401,188
Woollen manufactures, -	5,795,069	6,278,099
Total,	£43,344,631	£45,281,254

The gross amount of customs' duties inwards in 1838 was £22,966,214, and in 1839, £23,278,089. The gross amount of excise duties for the year ending October 1838 was £11,827,788, and for the year ending October 1839, it was £12,152,171; thus the customs and excise duties produce annually upwards of *thirty-four millions of pounds* to the national revenue.

MONEY.

Origin and Nature of Money.—In a rude state of society, exchanges are made by bartering one article for another, according to some kind of understood value. "But when the division of labour first began to take place (says Smith), this power of exchanging must frequently have been very much clogged and embarrassed in its operations. One man, we shall suppose, has more of a certain commodity than he himself has occasion for, while another has less. The former, consequently, would be glad to dispose of, and the latter to purchase, a part of this superfluity. But, if this latter should chance to have nothing that the former stands in need of, no exchange can be made between them. The butcher has more meat in his shop than he himself can consume, and the brewer and the baker would each of them be willing to purchase a part of it; but they have nothing to offer in exchange, except the different productions of their respective trades, and the butcher is already provided with all the bread and beer which he has immediate occasion for. No exchange can, in this case, be made between them. He cannot be their merchant, nor they his customers; and they are all of them thus mutually less serviceable to one another. In order to avoid the inconveniency of such situations, every prudent man, in every period of society, after the first establishment of the division of labour, must naturally have endeavoured to manage his affairs in such a manner as to have at all times by him, besides the peculiar produce of his own industry, a certain quantity of some one commodity or other, such as he imagined few people would be likely to refuse in exchange for the produce of their industry.

Many different commodities, it is probable, were successively both thought of and employed for this purpose. In the rude ages of society, cattle are said to have been the common instrument of commerce; and though they must have been a most inconvenient one, yet in old times we find things were frequently valued according to the number of cattle which had been given in exchange for them. The armour of Diomede, says Homer, cost only nine oxen; but that of Glaucus cost a hundred oxen. Salt is said to be the common instrument of commerce and exchanges in Abyssinia; a species of shells in some parts of the coast of India;

dried cod at Newfoundland; tobacco in Virginia; sugar in some of our West India colonies; hides or dressed leather in some other countries; and there is at this day a village in Scotland where it is not uncommon, I am told, for a workman to carry nails, instead of money, to the baker's shop or the ale-house.

In all countries, however, men seem at last to have been determined by irresistible reasons to give the preference, for this employment, to metals above every other commodity. Metals can not only be kept with as little loss as any other commodity, scarce any thing being less perishable than they are, but they can likewise, without any loss, be divided into any number of parts, as by fusion those parts can easily be re-united again; a quality which no other equally durable commodities possess, and which, more than any other quality, renders them fit to be the instruments of commerce and circulation. The man who wanted to buy salt, for example, and had nothing but cattle to give in exchange for it, must have been obliged to buy salt to the value of a whole ox or a whole sheep at a time. He could seldom buy less than this, because what he was to give for it could seldom be divided without loss; and if he had a mind to buy more, he must, for the same reasons, have been obliged to buy double or triple the quantity, the value, to wit, of two or three oxen, or of two or three sheep. If, on the contrary, instead of sheep or oxen, he had metals to give in exchange for it, he could easily proportion the quantity of the metal to the precise quantity of the commodity which he had immediate occasion for.

Different metals have been made use of by different nations for this purpose. Iron was the common instrument of commerce among the ancient Spartans; copper among the ancient Romans; and gold and silver among all rich and commercial nations.

Those metals seem originally to have been made use of for this purpose in rude bars, without any stamp or coinage. Thus we are told by Pliny, upon the authority of Timæus, an ancient historian, that, till the time of Servius Tullius, the Romans had no coined money, but made use of unstamped bars of copper to purchase whatever they had occasion for. These rude bars, therefore, performed at this time the function of money.

The use of metals in this rude state was attended with two very considerable inconveniences; first, with the trouble of weighing, and secondly, with that of assaying them. In the precious metals, where a small difference in the quantity makes a great difference in the value, even the business of weighing, with proper exactness, requires at least very accurate weights and scales. The weighing of gold, in particular, is an operation of some nicety. In the coarser metals, indeed, where a small error would be of little consequence, less accuracy would, no doubt, be necessary. Yet we should find it excessively troublesome, if, every time a poor man had occasion either to buy or sell a farthing's worth of goods, he was obliged to weigh the farthing. The operation of assaying is still more difficult, still more tedious, and, unless a part of the metal is fairly melted in the crucible, with proper dissolvents, any conclusion that can be drawn from it is extremely uncertain. Before the institution of coined money, however, unless they went through this tedious and difficult operation, people must always have been liable to the grossest frauds and impositions; and, instead of a pound weight of pure silver, or pure copper, might receive in exchange for their goods an adulterated composition of the coarsest and cheapest materials, which had, however, in their outward appearance, been made to resemble those metals. To prevent such abuses, to facilitate exchanges, and thereby to encourage all sorts of industry and commerce, it has been found necessary, in all countries that have made any considerable advances toward improvement, to affix a public stamp upon certain quantities of such particular metals as were in those countries commonly made use of to purchase goods. Hence the origin of *coined money*, and of those public offices called mints; institutions exactly of the same nature with those of the aulnagers and stampmasters of woollen c cloth. All of them are equally meant to a by means of a public stamp, the quantity and goodness of those different commodities when to market."*

It will be understood from these explanati money is only an article which can be conveni in exchanging. In itself, or as relates to its trinsic qualities, it is a thing but of small valu and silver, or the precious metals, of which usually made, are chiefly brought from the South America, and are commercially valued a to the cost of their production and their co demand, as is the case with every other object If an over-abundance of any of these metals obtained, and the demand be not increased, the immediately lowered; and if the supply is obta difficulty, while the demand remains steady creased, the value is heightened. It cannot strongly impressed on the mind of the reader, tha is but a metallic representative of something w been given for it. To a misunderstanding r this apparently very simple circumstance, most misery may be attributed. It has too often feeling of communities, that if they possess they possessed riches, and not a mere article tating commerce—an article which, from its na respect, is itself a commodity. The most start tration of this fallacy is to be found in the h Spain. Before the working of the gold mine American possessions, the Spaniards were a prosperous commercial people; but when th to find gold, they thought they had got at th that for which they formerly laboured, and th poor industrious man who has unexpectedly s to an estate, they need now work no longer. vent their riches from disappearing, the law p the exportation of the precious metals, and th tually shut the door against the only way in wh could be made sources of wealth—exportati article of commerce. In that view, and in th was there any advantage in the possession of g even had it been employed in the most adva manner, it would not have been so profitable other means of employing capital and labour already remarked, the peculiarity which make useful as a measure of value, is, that the la pended in producing it bears so constant a ra quantity realised, that but small profits are m its production.

The manner in which the Spaniards be quainted with the treasures of South Americ to nourish the hallucination. They found a able quantity of gold in the possession of th which they speedily seized. They found also m in the streams. Thus, by an accidental circu such as that of finding a hidden treasure, they possessed of money without working for it. not reflect that, if this lasted, gold would ce the representative of value which it was, and of no further service in commerce than as an e beautiful material for manufactures, which w tuate in value with the tide of fashion. Wh could procure the mineral only by the result labour, they still had the same preposterous fe they were possessed, not of the means of maki but of wealth itself, and dearly did they pay th While starvation desolated the land, and th grandees could not command so much of the of ordinary commercial industry as a glass every wretched dwelling glittered with mou plate.

Gold, it is necessary to repeat, is simply a co —a commodity which we import: and if we ca it profitably, why not do so? If the country tion will take nothing from us but gold, then i worth our while to buy gold for the purpose o

ined money of Great Britain is the most ele-
ecuted, and among the purest in the world.
ter part of the continental coinage is poorly
and basely alloyed. In Holland, and most of
nan states, the coins legally current as silver
e apparently one-third brass, and resemble the
d shillings and sixpences of a former period
nd. In France and Belgium, the new gold
r coins are handsome, and so likewise are the
l and silver pieces of Prussia. The coins and
ecuted by direction of Napoleon in France are
style of art.
st the current and standard coinage is fre-
ignified by the term *sterling*, as "one pound
"&c. With respect to the origin of the word
there are three opinions. The first is, that it
d from Stirling Castle, and that Edward I.
enetrated so far into Scotland, caused a coin
ck there, which he called Sterling. The second
erives it from the figure of a bird called star-
h appears about the cross in the ancient arms
nd. The third most probably assigns its true
y deducing it from Esterling; for in the time
r III. it is called *Moneta Esterlingorum*, the
the Esterlings, or people of the East, who
her to refine the silver of which it was made,
o it was valued more than any other coin, on
of the purity of its substance. The denomi-
the weights and their parts is of the Saxon
ling tongue, as pound, shilling, penny, and
which are so called in their language to the
lay. The term sterling is now disused in Eng-
all ordinary transactions, but is still used in
to distinguish sums from the ancient money of
try, as referred to in old deeds and notices of
y transactions. The old Scots money, previous
nion of 1707, was in pounds, shillings, and
ut these were only a twelfth of the value of
money of the same denomination; thus, a pound
s only twenty pence sterling. The word ster-
lso in use in the colonies, to distinguish the
ndard of Great Britain from the currency
these places.
llowing is a short explanation of the origin of
ipal terms used in reference to coined money.
d *money* is from the Temple of Juno *Moneta*,
money was first coined by the ancients. *Pe-*
s from *pecus*, a flock—flocks and herds of ani-
ng originally equivalent to money, or things
ing wealth. *Cash*, in commerce, signifies ready
r actual coin paid on the instant, and is from
ich word *caisse*, a coffer or chest in which
kept. *Pound* never was a coin; the term was
employed to signify a pound weight of silver,
wards it was applied to mean twenty shillings
or by counting. *Guinea* took its name from
t of Guinea in Africa, whence the gold for it
nally brought; at first, the piece was current
shillings, afterwards it was equal to 21s. 6d.,
y settled at 21s. In the present day the guinea
ined, and the term only remains to indicate
orary fees and gifts are still usually reckoned
s, though paid in other money. *Shilling* and
e both from Saxon words; the penny was first
silver. *Groat* was a name given to silver
ual to four pennies in value, coined by Edward
word groats is a corruption of *grosses* or great
d was given to distinguish this larger coinage
nies or small coins. *Farthing* is a corruption
ing, or the fourth part of a penny.
rency of coined gold is the most secure and
t, and the pieces are received for their proper
all countries. But notwithstanding these
es, a metallic currency alone is quite unsuit-
ighly commercial communities. There is no
importation of the precious metals, as the wealth
e, to supply material for a purely metallic

[illegible] a certain sum which is specified upon it. Whether passing by the name of a bank-note, a promissory-note, or bill of exchange, the principle on which it is issued is the same—an express obligation on the issuer to pay the specified sum in coined money on demand, or at a certain date which is mentioned. The notes of this kind issued by a bank pass from hand to hand, any holder having it in his power at any time to demand fulfilment of the obligation from the bank; but in the case of a bill of exchange, which is a promise by a private party, it is presentable for payment only at a specified period.

Bank-notes and bills together constitute the paper currency of the country, and are of prodigious use in carrying on commercial transactions. It is calculated that while the metallic currency seldom exceeds three millions, the paper currency, or amount of negotiable paper in circulation, is perhaps two hundred millions: of bank-notes alone, the circulation in the united kingdom may be reckoned to be sixty millions.

Bills of Exchange were first used for the purpose of settling pecuniary transactions between individuals at a distance from each other, and were therefore convenient expedients to avoid the risk of sending actual money to a creditor. This may be explained as follows:—If A, a merchant in London, have a debtor B and a creditor C, both in Paris, instead of sending money to C, and getting money sent to him by B, he may give C an order on B to pay the debt over at once to him. This is a bill of exchange in its simplest form. Suppose, however, that A has a creditor in Paris, but no debtor, while his neighbour E has a debtor, but no creditor: A may pay the money to E which the French debtor owes him, and obtain from him an order on his debtor to pay A's French creditor. This order he will be said to purchase. It will be an accommodation to him or to the other party, according to circumstances. In the complicated arrangements of modern commerce, the individual debtors and creditors are lost sight of. If a person has a sum to transmit to another country by such an order, the rate at which he will obtain it will depend on the pecuniary relations of the two places taken in the main. If there is more money payable at the moment by people in London to people in Paris, than there is payable by those in Paris to those in Lon-

[illegible] land.

The multifarious transactions t merchants in Britain and Americ process of payment by the interv change, many thousands of pou daily in their accounts with each of any metallic money, except a fe sums.

The following is a common form exchange:—

£100. London,

Three months after date, p the sum of one hundred pounds, v To Mr Thomas Sitles, Merchant, Cripplegate, London.

The bill being drawn in this form it, by writing his name either belo or across the face of the writing. called the *drawer*, now endorses th name on the back of it, and thus th *tiable paper*. It may be paid aw and he endorsing it below Noke away to a fourth; and he endorsin ner, may pay it away to a fifth; bill may pass from hand to han liquidating a debt of £100, till th the original acceptor arrives, whe by the last holder. Instead of ru bill may at any period be *discount* banker. The discounting of a b the money for it, less a certain su rest is a charge for the loan of mo reckoned by *per cent.* Thus five per annum, signifies a charge of one year, which is equal to a sh This is legally the highest interest When, therefore, a bill for £100 fourth part of a year) is discounte rest, a charge equal to the fourth by the discounter, and this is his the money for that period. Int on any sum may be easily calcula metic; but merchants and banke [illegible]

discount, the debtor is left unmolested till

money, which may be sent from place to
letter, and if accidentally lost, its payment
pped and a new bill forwarded to its destina-

BANKS.

Banks.—The term *bank*, in reference to
signifies a place of deposit of money, and is
m the Italian word *banco*, a seat or bench,
stodiers and dealers in money in Italy having
who sat on benches in the market-places of
al towns. It is worthy of remark, that in
of almost all modern civilised nations, the
ney-dealers were Jews, and in the present
s of that nation are the chief commercial
in barbarous countries. Their acute intel-
tient industry, and disregard of local attach-
e in all ages fitted the Jewish people for this
fe.

e reign of Charles I., Jews and goldsmiths,
aluable property had been assigned for safe
gan to exercise the profession of bankers in
but till a much later period there were seve-
bankers in London who still kept goldsmiths'

ontinent of Europe regular banking com-
ch earlier than in this country. The Bank

of Banking.—A bank is a commercial insti-
blished and conducted by private individuals
own behoof, or by joint companies. Like a
counting-house, it consists of various offi-
anager, cashier, clerks, &c., including tellers,
for receiving and paying out the money.
usually reckoned to be of two kinds—banks
and banks of *issue*. By deposit it is meant
nk takes charge of deposits of cash, which it
restore on demand. Some banks of this
w interest on the sums received, and others
; all, however, of necessity, make use of the
deposited, by lending it out at a certain rate
, and thus compensate themselves for their
The loans are most commonly in the form of
f bills, and occasionally advances on heritable
r other securities. Banks of issue transact
linary business of banks of deposit, and in
ue notes of their own instead of actual cash
s of others. Almost all banks in this country
both of deposit and issue; they at least issue
r as the law allows them, which is to the ex-
s of £5 in value and upwards. The only banks
to issue below £5 are those in Scotland, for
culiar law exists.

h banks are thus at liberty to issue notes to
, it is not to be supposed that they do so
certain degree of restraint. The expense of
ring notes, notwithstanding that each re-
stamp, is a comparatively small check; the
aint on over-issuing consists in the obligation
sum which the note expresses, on demand.
erefore, a banker discounts a bill for £100,
out one hundred notes of one pound each, he
the risk of having these notes returned upon
a demand made for them in cash within the
f a day or two thereafter. This risk is in-
the practice among bankers of never issuing
of others. They are cautious enough to grant

demands for cash. To accommodate the amount of this capital to the probable necessities of the case, is the point in banking for which the greatest skill is required, because if much capital is kept lying useless in the coffers of the bank, there is a loss of interest which may be ruinous, whereas, if too little is retained, a sudden run might utterly destroy the credit of the concern. When banking is managed with prudence, there is a certain amount of money kept at interest in the funds or government securities, upon which, if need be, an order is given. Thus a safety fund is established, whereon to fall back in case of emergency. A share of the subscribed and paid-in capital of the shareholders of the bank forms this safety fund; and it may be taken as a general rule, that where a bank is provided with no such security, but issues notes on the faith of the fund it may chance to have in hand, then that bank is trading on a principle alike dangerous to itself and the public. A banker who unites enterprise with prudence takes every available means to extend the circulation of his notes in as minute and distant channels as possible; for as long as a note is out, an interest is being received for the capital which it represents. In other words, when a pound note is out, it represents a sovereign which has been deposited or given for it, and which sovereign is employed in a fund in some manner of way at interest, for the advantage of the banker.

On considering the various operations connected with banking, it will be found, that, independently of the impulse and elasticity created by the facilities given to commerce, the direct and primary effect of them is the employment of waste money. A bank gathers, as it were, the money of a district into its hands, and, allowing each man to use as much of his own share as he requires at the time, keeps the remainder likewise in employment, which it would not have been had it remained in its owner's hands.

The rapidity with which all kinds of payments are made, and therefore the frequency with which money can be used, through the instrumentality of banks, form their most striking feature. In a bank office the same sum of money will have been made the means of paying its amount a dozen of times over in a day without being once uplifted. A, who is due B L.100, gives a cheque for the sum, which will make it stand in his name instead of A's. B gives a similar cheque to C; C to D;

Bank of England trades not only on its paid-up l, but on the capital confided to it in the form of ts, and usually called its liabilities. This is per- legitimate, and consistent with the true principles nking, it being only necessary to take care that titution always leaves itself a sufficient fund from to satisfy all demands. The issue of notes by nk is understood to be somewhat in accordance ne amount of its deposits; but this is necessarily lent on various contingencies in public affairs. nding feature in the character of the institution circumstance of its acting as the banking-house government. All the money drawn in the form s or otherwise for the public service is consigned bank, while all drafts for the public service are e made from it. In carrying on this branch of ness, the bank allows the government to over- s account, that is, to take a loan of cash to a amount. The money so lent was some time wards of L.14,000,000, which parliament made sion to reduce and finally pay off. The impor- rvices rendered to the government, have in past secured to the bank most valuable privileges, ting almost to a monopoly of the business in

In 1797, when the bank found itself unable a run made upon it for gold for its notes, the ment of that day summarily protected it from ptcy by issuing an order that Bank of England hould be considered a legal tender; consequently, ders of notes at the time were, by force of law, l their value in cash. This extraordinary state irs, with various modifications, lasted till 1821, sh payments were resumed. Meanwhile, the f the bank, from not being representatives of were considerably depreciated in nominal value; at was the depreciation at one time, that four notes would have been given in exchange for guineas. It has been frequently represented as us hardship, that debts contracted during this nce of a depreciated currency, have had to be a currency of full value; for by this means the x receives perhaps a third more money than the value of the original sum owing.

-Stock Banks in England.—A parliamentary was published early in 1840, relative to these shments, from which it appeared that the number t-stocks in England, at 1st January 1840, was considerable proportion of which had been insti- within the preceding ten years.

number of partners in these banks varies from 1200, and may average about 300. There are dozen with less than fifty partners, the smallest r being seven. Fifty-eight of the banks have es, and fifty have none. The branches, includ- e parent bank, are from two to sixty-seven in r. There are eight banks which have more than branches. The whole number of parent banks anches is 658.

re are besides about 550 *private banks* in Eng- that is, banks having not more than six partners. g these to the joint-stock banks and their branches, hole number of banking establishments will be 1200.

e issues of the joint-stock banks, when contrasted he magnitude of the establishments, seem to us ex- gly small. According to the last return (August 2, , the notes in circulation of all the joint-stock s were in value L.4,665,110. This, divided by umber of banks (108), gives an average circu- of only L.43,200 for each; or, if we include the hes, the average for each office or establishment y L.7000. Supposing the money to be employed counting at five per cent., the annual profit on 55,000 would be only L.230,000, or no more than to each establishment. It is evident that their s must be chiefly derived from deposits, which an employ at five per cent., while, we believe, give only two.

e issues of the *private* banks, by the same return, were L.7,610,700, which gives an average of about L.14,000 for each establishment. It appears that the joint-stock banks, so far from superseding the private banks, have had but a very slight effect in narrowing their issues.

The chief advantage conferred on the Bank of England, and constituting its charter of monopoly, is the privilege of being the only bank in London, or within sixty-five miles of it, having more than six partners, which can issue notes payable to the bearer on demand. The bank has also the privilege of its notes being a legal tender by other banks for any sum above L.5, so long as it pays its notes in cash on demand. This provision is a security to all other banks against the effects of sudden runs upon them for gold. It is ordained by act of parliament, that "upon one year's notice, given six months after the expiry of ten years from the 1st of August 1834, and upon repayment by parliament of all sums that may be due from the public to the bank at the time of the expiration of such notice, the exclusive privileges of banking granted by this act shall cease and determine at the expiration of such year's notice." Hence, in 1844–5, there will necessarily be a renewal or modification of the peculiar privileges of the Bank of England.

Stocks—Stock Exchange.—There are various kinds of stocks. Shares in a joint-stock company are called stock, and so are shares of debts due by government. It is the last-mentioned stock, which is variously termed *public securities*, or the *funds*, that requires to be explained, and in doing so we take the liberty of using the definition of a popular writer.*

"In every war in which this country has been engaged since the Revolution, the amount of the annual taxes has been found inadequate to defray the expenses of government. To supply the deficiency, our rulers have generally had recourse to loans—that is to say, they have borrowed money from such individuals as were able and willing to lend it, giving these individuals a security for the payment of a certain annual interest. To explain the nature of this transaction, I shall take a very simple case. Suppose, then, that L.100 is the sum which government wishes to borrow, and that an individual offers to lend that sum at an interest of 5 per cent. On paying down the money, the lender receives a bill, bond, or acknowledgment, for the amount; by which acknowledgment he is entitled to draw yearly from the public revenue L.5 of interest, but on the express condition that he is not to demand repayment of the principal, or sum lent, unless government is willing to repay it. The person who thus possesses the bill or acknowledgment is said to be a *holder of* L.100 *of 5 per cent. stock*, and the money lent upon that bill constitutes a part of what is called the *national debt*, because it is in fact borrowed by the nation, and the interest is paid out of the taxes. It is obvious, however, that few persons would be disposed to lend money on the condition of never being allowed to demand repayment, even though they were quite certain of receiving annual interest, and of transmitting the right to that interest to their posterity. To remedy this inconvenience, therefore, the lender who wishes to employ the sum which he lent to government in any other way, though he cannot directly demand repayment, is at liberty to sell his bill to any body who will purchase it, and for any sum that another may be willing to pay for it. In doing so, he merely sells to a second person the right which he himself possessed to the annual interest of L.5, and that second person is of course at liberty to dispose of his right to another in the same way. This transaction, in general, is called a *transfer of stock*; and in the particular case which I have supposed, the one is said to sell, and the other to buy, L.100 of 5 per cent. stock. If 5 per cent. be considered as a fair and equitable interest for money lent, it is obvious that such a bill as I have now been speaking of, or, in other words, that L.100 of 5 per cent. stock, is just worth L.100 sterling. It is possible, however, that

* Blackwood's Magazine: 1818.

is at the rate of something more than 5¼ per cent. For simplicity of illustration, I have supposed that L.100 is the sum borrowed by government, and that of course there is just one bill to be disposed of, or transferred by the lender. If it be supposed, however, as is really the fact, that the loans generally amount to several millions, the necessity which the lenders are under of selling their bills, or, in other words, transferring their stock, will be more apparent. The transaction between government and the lenders is precisely the same in the case of millions as in that of a hundred; and it is unnecessary, therefore, again to illustrate the general principle of that transaction. It is evident, however, that even the most opulent merchants, who are generally the lenders, cannot be supposed to have such a command of money as to be able to advance ten or twelve millions to government at once. When they contract for a loan, therefore—that is, when they agree to lend to government the sum required—they generally pay the money by instalments, or partial payments at certain intervals, say one million a-month, till the whole is advanced. In the mean time, they sell or transfer the bills or securities which they receive from government to those who may have money to lay out at interest, and who of course will be disposed to purchase such bills, so that the sale of the bills of the first instalment may enable them to pay the second. In this way, government securities or bills become articles of commerce, and their price is regulated, like that of any other article, according to the supply and demand.

It is easy to see how the price of stock is liable to fluctuation from accidental circumstances. I shall not attempt to enumerate these: but it may be worth while to point out how it is affected by peace and war, as these two conditions of the country are generally found to have the greatest influence in raising or depressing the value of stock. In the time of war, then, the price of stock is comparatively *low*, because, in such a state of things, it is likely that government will be under the necessity of borrowing; and as every loan produces new bills, the quantity of those to be disposed of, or, in other words, the supply of the market, will be increased. The price, therefore, will fall, for the same reason that

The business done by the Scottish banking-houses is prodigiously increased by the institution of their branches in the provincial and country towns. From those banks already noticed, which are situated in Edinburgh, and from two or three of the chief provincial banks, there were altogether deputed, not long since, about one hundred and forty branches, and this number is undergoing a regular increase. These subsidiary establishments are to be found in every town of any note, from the borders to the most northern point of Scotland. They are conducted by resident wealthy or responsible merchants and others, who give securities for intromissions, and are subjected to a very rigorous supervision by inspectors, who are continually travelling about for this purpose.

The prudent and enterprising manner in which the business of banking is conducted in Scotland, has often been the subject of remark and commendation. Several reasons may be assigned for the remarkable stability of the Scotch banks. Each bank, before gaining credit with its neighbours, must show that it possesses a sufficient paid-up capital, with a reserve fund in London, on which orders for balances may be given. It is also the custom of the banks to exchange the notes of each other once or twice a-week, by which means the notes are sent very speedily back to the issuers, and thus an over-issue on the part of any single establishment is prevented. There can only be an over-issue by all the banks in the country becoming equally reckless, a thing not likely to occur to any serious extent. A third cause of the stability of the institutions, is the liability of shareholders for the debts of the establishment. Excepting in the case of the three old-established banks above specified, all the shareholders in the various banks are liable not only for the amount of their own shares, but for the shares of all the others; and the whole of their property may be seized to make up deficiencies. Although many of the shareholders are certainly not men of opulence, a number are so; and as their fortunes are good for the paper issued, the public runs no risk of injury. To strengthen this liability of shareholders, by the law of Scotland all heritable property, lands and houses, may be seized in satisfaction for their debts. As this is not the case in England, where personal or moveable property can alone be taken by creditors, it would not be possible to establish banks in the south part of the island on the principle of the Scottish banks, till the law touching heritable property be altered.

Other causes, not of a legal nature, conspire to render the system of Scottish banking perfect. By reason of the circumscribed limits of Scotland, and the character of the people, a ramification of intelligence is created and preserved throughout the whole of society, altogether unknown in England, whereby the character, the wealthiness, and the conduct of the partners or directors of each bank, are made fully known to the rest. All seek, and all find, a knowledge of the management of each other. All are mutually on the watch; and symptoms of over-issues or other improprieties are spread with an amazing celerity, and have their immediate effect.

In comparing Scottish banking institutions with those in England, and considering the different manner in which paper money has been guided by the two nations, the uniform security of the former appears almost miraculous. From the first issue of the bank-notes in 1704, till the year 1830, a single panic or general run did not occur in Scotland, although, during at least two-thirds of the intervening period, paper money had been used to the almost total exclusion of a gold cur-

tish banks grant loans of fluctuating amount, called *cash accounts*. By a cash account is signified a process, whereby an individual, on entering into an arrangement with a bank, is entitled to draw out sums as required, to a stipulated amount, and by an implied condition to make deposits at his convenience towards the liquidation of the same.

Cash accounts are said to have originated from the following circumstance:—A shopkeeper in Edinburgh, in the year 1729, found himself at times in the possession of more than a sufficient supply of ready money to carry on his trade, the overplus of which he consigned to the care of the neighbouring bank. But on other occasions, by reason of the length of the credits given to his customers, his money became so scarce, that, after exhausting his bank deposits, he still felt himself in difficulties. Several dilemmas of this kind having occurred, he was prompted to make a proposal of a novel nature to the bank, to the effect that, if it would accommodate him in straits with small loans, he would always shortly afterwards make up such debits, and that the parties should come to a balancing of accounts at periodical intervals. It seems this proposal was acceded to. A cash credit, or liberty to draw to a certain extent, was instituted under securities; and thus originated a system which has been of immense benefit to bankers and traders, and is now followed over the whole of Scotland.

Cash credits are guaranteed by two sufficient securities, or the applicants give infeftment to heritable property in caution of the contingent debt, and when any such debt is liquidated, the deed is cancelled. The expense of expeding a cash credit varies according to the amount of the desired loan. One for L.500 may be stated at about L.15. The deed requires no renewal. At the end of every six, and in some cases twelve months, calculations are made of entries and debits; the interest for and against the bank—the one being a per cent. higher than the other—is added and balanced, and an account being then rendered, the balance, if in favour of the bank, is either paid up, or remains against the debtor at interest to his new account. Such regulations being abso...essential to the existence of a social state, we ...fely infer, that no sooner were any portion of ...nd advanced into that state, than law began to ... Its origin, being thus early, is necessarily ob...: we know extremely little of its history in any ...nations of antiquity besides Greece and Rome. ...reecian history, we find more than one well-known ...f laws; but so limited and simple was their ope..., and so little are they adapted to the wants of a ...icated state of society, that they are to be looked ...rather as the municipal regulations for the tem...e government of a small knot of men, than as ...s from which any additional hints are to be ob... to aid modern jurisprudence. It does not appear ...e been in Greece—the source, as it was, of philo..., literature, and art—that useful laws, applicable ...business of life, had their origin. The Phœnicians, ...ose history and institutions we unfortunately know ...le, seem to have been among the first to establish ...ral system of mercantile law, which their exten...mmerce distributed abroad. To Rhodes, which ...arcely be considered a province of Greece, we ...he earliest regulations applicable to shipping. ...w of average, or that by which the loss occasioned ...owing goods overboard to relieve a ship in dis... is laid proportionally on the whole property saved ...st important branch of the commercial code of ...n nations), had its origin in that state, and is still ... the Rhodian law.

...re is the less importance in the inquiry into the ...f early nations, since all of ancient law which con... to have any force in civilised Europe, has come ...through one channel—namely, the Roman law. ...European nations, being, as it were, the remoulded ...s of the Roman empire, have obtained the basis ...r laws from that source. The Roman law is, there...y the common consent of Europe, denominated *The Law*. In Europe, there was but one other system, ...early period, to combine with it. This was *The ...l Law*, or that code of usages which had sprung ...European nations before they received the civil ... It is, after all, only in some countries that the ... law exists: in other cases, the civil law has ...ished a proportionate, and in some a preponderat... influence. In Holland and Germany, the original ... of the principles of the civil law have been pre...d with such zealous care, that the writings of the ...rs of those countries are quoted as authorities on ...s of Rome. In Spain, the system has been grafted ... feudal law, and on some peculiar customs derived from the Moors. In France, previously to the Revolution, the civil and the feudal law were united, as in most other nations of Europe; and in the Code Napoleon, which we shall hereafter have more particularly to notice, there are many regulations from the jurisprudence of Rome allowed to exist, or revived, while many of the feudal customs which were formerly so prominent are abolished. England distinguished herself from the other nations of Europe by rejecting the civil law as authority, but many of her institutions were derived from its spirit and practice. "With all its imperfections," says Sir William Jones, "it is a most valuable mine of judicial knowledge; it gives law at this hour to the greatest part of Europe, and, though few English lawyers dare make such an acknowledgment, it is the true source of nearly all our English laws that are not of a feudal origin." In Scotland, the Roman law has always been a special subject of study; and though the number of native decisions, the extent of statute-law, and the necessary adaptation of the system to a state of society very different from that in which Justinian promulgated his laws, have rendered references to this source comparatively unfrequent, the civil law is still authority where the particular law of Scotland does not contradict it. It is a special object of study by the legal profession, and is the subject on which the members of the bar are first examined before they are admitted to practice. To complete the general outline of the influence of this system in modern Europe, it must be mentioned as the source of the canon law, which was created into a system by the Church of Rome, and still exists more or less, either separately or incorporated with other systems, in all countries where the papal authority was acknowledged. The law of nations, or international code, has been, by the common assent of civilised nations, derived from the law of Rome.

Writers have divided the legislative sources from which the laws of Rome spring into five. Among the first of these is generally classed the people, and the laws sanctioned by them are technically divided into the *Lex* or *Populiscitum*, and the *Plebiscitum*, the former including the acts of the whole people, the latter those of the plebeians convened by their tribunes. It would appear that, in the earlier periods of the monarchy, the authority of all classes was in this description of legislation tolerably equal. Servius Tullius, however, the sixth king, introduced the well-known divisions into centuries and classes, by which ninety-eight votes were secured to the first class, while ninety-five only were allotted to the remaining five, of which the lowest and most numerous possessed only one. The tribunes, who were officers chosen for the ostensible purpose of protecting the people from the tyranny of the aristocracy, were, by the exclusive and important power they possessed, again the means of restoring popular decision-

and paternal assistance in legislation, gradually extended itself to that of making laws. It was not till the days of Tiberius that these decrees were publicly promulgated as laws; but the senate had by that time lost its independent authority, and become merely an instrument in the hands of the emperor. The proceedings of the senate were generally suggested by some public officer, as a minister of the crown now introduces a bill into parliament, and a majority decided for passing or rejecting. In later times it became the practice for the emperor to propose a new law either by a message or letter laid before the senate, or by an oration delivered; and as there was no opposition intended or permitted, the legislative body became the mere registrars of the monarch's will.

Another source of the civil law is the constitutions and rescripts of the emperors. At what time they commenced the practice of making laws without the nominal concurrence either of the senate or the people, is not very distinctly known. A passage in the Pandects, the authenticity of which, long doubted, has been confirmed by late discoveries, states that the will of the emperor is law, and that by a particular act, the people had conferred upon him all their own power, which was thenceforth absolutely to remain in his hands—one of those transactions under the guise of which rulers are so fond of concealing their lust of power, by representing as a free gift that which no one can venture to refuse. Hadrian is believed to be the first emperor who exercised the authority of a supreme legislator. The imperial laws were issued in a variety of forms. Sometimes there was a new constitution springing from the monarch's own creative mind—on another occasion he would give his imperial judgment on some nice speculative question of law dutifully submitted to his wisdom. Many of the imperial laws, however, were the decisions of the monarch in particular cases, the spirit of which was piously preserved by the lawyers of the age, as the best criterion for a general rule of action. In modern times we associate with despotism a horror of innovation, and a desire to leave all institutions, whether expedient or hurtful, untouched. It was different in

The most brilliant era of wisdom commences within a short period of the of the republic, and terminates with the reign xander Severus. Mucius Scævola, the tutor of , was one of its earliest ornaments; and it in- the celebrated jurisconsults Paul, Ulpian, Papi- Capito, and Labeo. The two last of these, who in the age of Augustus, were the founders of the cts—the Proculians and Sabinians—into which oman lawyers were divided. The former advo- the doctrine that the laws should be amended at tion, to meet circumstances as they occurred; ter maintained the theory of their strict interpre- , be its inexpediency in the particular instance it may. Capito, applying his doctrines to the s which the emperors were gradually making in reedom of the republic, was a supporter of this s of innovation, and his followers were enrolled the ready tools of despotism. Labeo sought to rt the ancient freedom of the republic by an nce to the letter of the old laws, and his sect e the champions of what may be termed consti- al freedom. The conflict is not unlike that which existed in Britain between Lord Mansfield and Camden; the former supporting, to a certain degree, an equitable, the latter, in all cases, a strict interpretation of the law.

Having now enumerated the principal sources of the Roman law, we may notice its remarkable epochs. The laws enacted during the reigns of the kings, although a curious subject of inquiry among antiquaries, exercised too little influence on the civil law, as handed down to modern Europe, to be of much practical importance. During the administration of the decemvirs, the celebrated laws of the Twelve Tables were adopted. The traditionary history connected with this code is, that the Roman government, conscious of the want of a proper legal system, sent commissioners to Greece, who, after studying the laws of that comparatively civilised nation, produced the Twelve Tables for the acceptance of the Romans. The tradition, like many others connected with the Roman history of the period, has not sufficient historical evidence to support it against its natural improbability. These laws, of which specimens are professed to be preserved, are written in a language so different from that of the classical writers of Rome, that they were to Cicero an object of much the same curiosity as the old Scottish acts were to Bacon. Like the first laws of other rude states, they are simple and brief in their enactments. The bankruptcy system, which has so sadly shocked several benevolent scholars, that they have endeavoured to explain it as a merely symbolical provision, is peculiarly sharp and effective. It enacts that the insolvent debtor shall be cut in pieces, and that his body shall be distributed among his creditors. When law became a science openly studied, the Twelve Tables became the subject of many commentaries. It was not, however, till the Romans had been for some time degenerating, that those great collections of legislative wisdom which have come down to modern times were commenced. The first attempt to construct a code, seems to have been the Perpetual Edict of Hadrian, already alluded to. Two private individuals, Gregorius and Hermogenes, appear to have collected the imperial constitutions into a system, or code, of which some fragments are still preserved. Nothing whatever is known of the biography of these compilers: it has not even been discovered in what reigns they respectively lived, though their labours received high commendation at the hands of Theodosius the Younger. Under this emperor, the celebrated Theodosian Code was promulgated, in the year 438. The compilation of this body of laws was committed to eight individuals, who were allowed considerable latitude in explaining and abridging, and even in supplying deficiencies. It contains the legislative acts of sixteen emperors, from the year 312 to 438. Fragments of this code have been rescued from oblivion inch by inch, by modern scholars, whose labours, it may safely be calculated, have amounted to some twenty or thirty times more than those of the original compilers. The celebrated Godefroy of Geneva spent thirty years in the task; and within the last twenty years, the discovery of some further fragments induced the celebrated Angelo Mai to study the Roman law for the purpose of editing them.

It is now our turn to notice those great collections of the legal wisdom of the Romans, to which the above may be considered only preparatory. In 529, ten commissioners, appointed by Justinian, prepared *The Code*, or *Codex*, as it is termed, from the collections previously made, and the intermediate enactments. Soon after its promulgation, the emperor issued several new constitutions, and the whole were consolidated and re-issued in 534. This great task was superintended by the celebrated Tribonian, whose eminent learning and discrimination, allied with untiring industry, but stained by the vices of corruption and partiality, have afforded a fruitful theme of praise and obloquy. This was by no means Tribonian's only labour. In the year 530, he was appointed the chief of a commission of sixteen, whose duty it was to cull the choice and useful passages from the authors of comments and opinions. The various authorities, which, we are told, would have made several camels' loads, were thus reduced within

of Novels, form the remaining department of the "*corpus juris*," or body of the civil law.

With Justinian we reach the climax of the Roman law; and to trace its farther progress in the empire has been more a subject of curiosity to the antiquary than of importance to the lawyer. Some fragments by later commentators, chiefly in the Greek language, have been disentombed by zealous searchers. The Roman law was nominally respected by the northern conquerors of Rome. Alaric, King of the Visigoths, indeed, caused a compendium to be prepared for the use of his dominions, consisting chiefly of an abridgment of the codes of Gregorius, Hermogenes, and Theodosius. Towards the end of the ninth century, Basilius, Emperor of the East, issued a new code, intended to supersede the labours of Tribonian, termed the "*Basilica*."

In the dark ages, however much of the Roman law may have remained in practice, it had died away in literature, and was neither studied nor commented on. At the taking of Constantinople in the fifteenth century, only one copy of one of the Justinian labours, *the Novels*, seems to have been discovered. It was long believed, indeed, in the learned world, that from the period of the Basilica to the twelfth century, the very existence of the Roman law was among the things forgotten. The circumstances of its resuscitation were found in a traditional anecdote, that at the siege of Amalphi in 1137, some Pisan peasants discovered a complete copy of the Pandects among the plunder, the melodious language, comprehensive philosophy, and clear definitions of which, so charmed the readers of that barbarous age, that its contents were immediately devoured with avidity and propagated with zeal. In Florence, a manuscript is still preserved, said to be the identical book with which this anecdote is connected, taken at the siege of Pisa in 1406. The essence of the tradition has been disproved by late discoveries, which show that the civil law was known previously to the siege of Amalphi.

The real revival of the civil law is to be traced in the history of the universities. Of these, Paris, Bologna, and Leyden, took the lead in the department of jurisprudence. Contemporary with, or immediately after the siege of Amalphi, lectures were given on the Pandects in the University of Oxford, by a teacher of the name of Vacarius. For reasons which we shall have to state when we come to treat of the laws of England,

modern investigators in this sub

The smaller states were bound to it; but America resisted, and the dispute occa- l a bloody war. So it probably will be again, when me claim is urged. Instead of being a fixed law able to all, the weak will have to obey, and the g will resist. For the enforcement of any rules may be called the law of nations, then, it is clear there is no better sanction than this, that the ns which openly outrage them will call forth a e of indignation on the part of the rest of the l which may prove dangerous. The partition of nd, for instance, called forth the indignation of the f Europe; and it may be still a question whether equisition was a prudent one to the nations con- d. It is not to be supposed, however, that there re courts where the law of nations is enforced. i country in Europe has generally a court where n views on the subject are laid down. England for instance, the prize jurisdiction of the Court of ralty, which is thus called a civil law court. Dur- he late war, when Napoleon by his Berlin decrees ed Great Britain and her colonies in a state of ade, and Britain retaliated by the orders in coun- l the rest of Europe, a multitude of cases where ips of neutral powers had been seized for breach utrality were adjudged. And here a circum- occurred which could not take place probably other country, that the view taken of the law ions by the judge was different from that taken government; for Lord Stowell declared that a cle could not be held to exist by mere proclama- nt that there must be present on the spot an ent sufficient to enforce it.

of the principal defects of the writings in the w, and one that renders the subject in a great re unpopular at the present day, is the spirit of ation with which they are imbued, and the extent ch they carry divisions and arrangements which no service in practice, and provide for wants hypothetical. The civilian in his study, shut out he world and ignorant of its pursuits, set his t work to create the various exigencies of prac- fe to which the maxims of the institute were ap- e, and to devise how they could be applied; but his labours were brought to the light of day, it und that the world in its practice and he in his ts had taken totally different routes, and that e could not be the companion of the other. If r make clothes with another man's cloth, to which two shall they belong? If an artist paint on r man's canvass, who shall be the proprietor of cture? Such were among the subtleties discussed the Roman jurists. In later days, when legisla- ve too much to do in keeping up with the prac- emands of society to indulge in hypothetical law g, such subjects would not be taken up until cases culty actually occurred; and then, before deciding stract questions, it would probably be asked under circumstances tailors are likely to make garments cloth which does not belong to them, or artists nt on other people's canvass?

THE CANON LAW.

e Canon Law is, properly speaking, the ecclesias- law of the Roman Catholic Church. In its more d acceptation, it may be called the by-laws of the ch as a separate corporation; but its field widened the influence of the hierarchy. It embraced many cts of purely civil and municipal law, such as the ibution of property between married persons, suc- on, &c., by linking them with ecclesiastical matters; thus the clerical tribunals came to rival, if not to in importance, those of the state. The canons e Greek Church, a portion of which were said to e work of the apostles, added to and explained by ral councils, were sanctioned by the Novels of Jus- tinian, and have so been viewed as a portion of the body of civil law. A collection of canons was made in the year 520; and this work, with the papal decrees, and the privileges conceded to the church by Charlemagne, formed the chief subject-matter of the canon law down to the twelfth century. It was then that this law ceased to be the mere regulations of a peculiar body, and became a general system of jurisprudence. About the year 1114, a collection of the decrees of popes and cardinals was commenced by Ivo, Bishop of Chartres, and was revised and completed in 1149 by Gratian, a Benedictine monk. Another element in the system consisted of the Decretals, which were rescripts or epistles by the pope, or by the pope and cardinals, deciding how the law of the church stood concerning disputed matters referred to them. These were first collected and edited in 1234 by Raimond de Renafort, chaplain to Gregory IX. This work was divided into five books, to which a sixth was added under the auspices of Boniface VIII. in 1298. These two great works, with some additions made to them by succeeding popes, formed what, in imitation of the collected works in the law of Rome, was called the *Corpus Juris Canonici*, or Body of the Canon Law. Besides these general statutes, there were local canon laws passed by the clergy of various countries, at national or provincial assemblies, held under the auspices of papal legates or archbishops. In the reign of Henry III. there were assemblies of the former kind; and under the respective archbishops of England, there were frequent provincial synods. In Scotland, two provincial synods, held at Perth in 1242 and 1269, passed some important laws regarding tithes.

The great aim of ecclesiastical legislation was to bring civil questions within its pale. Disputes as to tithe and the privileges of the clergy came very naturally to its hand. The priesthood were in a great measure intrusted with the administration of legacies, especially where they were destined to pious uses; and they thus acquired a jurisdiction in questions of succession, of which we see vestiges in this country, in the Court of Arches and the other ecclesiastical courts of England, and the commissary system in Scotland. Marriage being constituted a sacrament, the canon law not only took into its hands all questions regarding the union and separation of the parties, but adjudged in the criminal act out of which the latter circumstance might arise, and took under its cognisance questions as to dower. The church obtained a powerful hold over the proceedings of ordinary courts of law, by the introduction of the practice of witnesses and parties calling God to attest the truth of their statements—the origin of the present system of administering an oath. Over this ceremony, and all matters connected with the truth or falsehood of the statement it sanctioned, the clergy took a particular charge. Notaries, who in the days of ignorance were intrusted with the execution and registration of contracts—who, in fact, were the living registers of almost all transactions of importance, were necessarily taken from the only class who could write—the churchmen, and their appointment and removal naturally fell into ecclesiastical hands.

A great rivalry thus existed between the civil and the canon law; but it was a friendly rivalry. The clergy were the repositaries of both systems, and they had to decide how much should be assigned to the one and how much to the other. The canon law borrowed largely from the civil, of which it is sometimes considered a mere branch; it was naturally, indeed, the object of the clergy not so much to change the law itself, as to take the administration of it into their own hands. To be *juris utriusque doctor*, or doctor of either law, civil and canon, was a common distinction. During Henry VIII.'s reign, lectures on the canon law were abolished in England, and with them the corresponding degree. Jealous as the English were of the encroachments of the civil law, they still more determinedly opposed that of the canon. What the powerful court of Rome had set its heart upon, however,

thus the ostensible origin of the British parliament. Trial by jury has been traced to a similar source. The constitution of the German empire is essentially feudal, and the customs, or peculiar local laws of the various provinces of France, previously to the revolution, were models from which the system was studied. The English law, especially that of real or landed property, is full of feudal usages, though their operation has often been checked. In Scotland, the forms of the feudal system may be found existing in almost original purity, though, as we shall hereafter see, they have been adapted, perhaps as far as they are capable of being so, to the wants of civilised times.

An account of the rise and progress of the Roman law must, for obvious reasons, be far more satisfactory than any that can be given of the feudal system. The former was (at least the greater part of it) the construction of ingenious individuals, possessed of authority to enforce their mandates on their fellow-beings. The latter gradually rose out of circumstances, and the state of society. It was not devised by a powerful legislator, to be promulgated to a willing people; but it rose out of habits and events which took place in an age when there were no historians to record their progress. Hence, the origin of the feudal system has been a fruitful subject of debate and theory; and in the absence of facts, it has often been necessary to resort to moral deductions. It has been maintained by some, that nothing can be more simple than the feudal system; that it was a mere arrangement by which military service was given in exchange for land, and that many half-civilised nations present instances of a similar contract. Ingenious speculators have found the resemblance of the system in particular stages of the history of Greece and Rome, in Turkey, Persia, Hindostan, and the Highlands of Scotland, among the aborigines of North America, and in the Loo-choo Islands. But, however important may be the investigation of such analogies between the practice of mankind under different circumstances, as a part of the history of the human mind, they throw but little light on the feudal system, the chief interest of which is to be found in the vastness of the field which it covered, and the influence which it has exercised for so many centuries over the legal institutions of Europe.

udal origin may be as distinctly traced, on
e, in the relation of master and servant in
a. Servitude, however menial, when allied
lependence, did not carry the same degra-
re slavery; and in the opinion of some, the
the feudal attendant was higher than that
l servant of modern days, who freely gives
his labour and attendance for a price. In Scotland, where feudal usages have lingered so long, it has been remarked, that the relation between master and servant is of a more confidential nature than it is found to be in other parts of the country. While the line drawn between their positions is as clear as it can well be in a free country, the situation of the servant has a more than ordinary share of respectability attached to it, because, instead of being the individual servant of an individual master, he and his race are looked upon, to a certain extent, as the retainers of the house which he serves. On this point, indeed, an adherence to feudal usages in situations to which they are not applicable, has been productive of one of the greatest evils of modern society—the extent to which servants are kept, not for use, but as an ornamental evidence of wealth. Our lineal aristocracy continue to follow, so far as the usages of the day permit, the practice of their ancestors; and the gentlemen of plush and shoulder-knots are the representatives of those who wore buff jerkins, and handled the pike. The rich merchant and manufacturer must not be without the usual insignia of wealth; and thus a race, whom idleness and constant association with each other must deprave, are kept up among a bustling and active community, as if we lived in the days when the majority must either serve or starve. It has been remarked, that in republics such as Holland, the wealth of rich individuals generally took the more ennobling direction of patronising the arts and literature.

In the earlier ages of the feudal system, when there was much land to distribute, the natural features and boundaries were sometimes little known to those who gave it away. The persons who received it were aggrandising and ambitious, and not likely to yield to each other disputed portions. Above all, the conquerors were uneducated, and had little means of giving perpetuity to their bounty by written deeds. From all these circumstances, the investiture of the vassal became a very important and solemn affair. Investiture was divided into proper and improper. By the former, the superior went in person to the land, assembled all his other vassals upon it, and showed them the portion he had assigned to his new follower. The vassal, upon this, did homage, accepting the grant, and promising to perform the usual services in return. By the improper investiture, of the full practice of which in our own day we shall give an instance, the superior gave authority to his bailiff, or some other person, to give investiture, which was done by the symbolical delivery of a portion of the property—some earth and a piece of stone generally—to the vassal, or some person authorised by him to accept the grant and perform his homage. Writing was probably in use before this latter usage was commenced, and the authority was generally a written one. The solemn investiture in presence of the co-vassals finally descended to a mummery between an attorney and his clerks. The necessity to have acts regarding the fiefs of a superior witnessed by his vassals, can be traced to a connexion with two of the most important institutions of modern times. The great vassals of a king, met together in public assembly to discuss what aids they might afford for their fiefs, how they were to defend them, &c., merged into a great council or legislature; and it is to such a body that the British Parliament at least partly owes its origin. At this moment, the Bishops of England sit in the House of Lords in virtue of the feudal baronies which they hold of the crown. Vassals of the lower grade were often summoned to attend at the hall of their lord as assessors, or assizers, to give, partly opinion, partly evidence, concerning some matter connected with the fief, or the conduct or rights of a fellow-vassal. With this institution, the system of trial by jury is intimately connected. A jury of perambulation, for the purpose of ascertaining boundaries—a sort of body lineally descended from the assemblage of co-vassals who were present at the investiture, and witnessed the extent of the gift—has been known in modern times.

such an alienation, however, the vassal dared not in any way interfere with his superior's rights; the latter, indeed, was not presumed to be conscious of the sub-infeudation, unless he had specially sanctioned it, and by doing so, he acknowledged the sub-vassal as his own immediate retainer. When a vassal, therefore, sub-feued without his superior's consent, he gave only a portion of the estate he himself possessed, his sub-vassal being liable to meet all the exactions that might fall upon him. So, if he rebelled against his lord, or withheld the feudal exactions, the superior could seize upon the fief without reference to the claims of the sub-vassal. The highest feudal noble was the Heretoch, who, from the Latin *dux*, a leader, received the designation of duke: this class was intrusted with the administration of large provinces. The graf, who had a smaller charge, was called *comes*, or count; and one class of graf, who was intrusted with the marches, was called the *mar-grave*, *march-graf*, or marquis. These nobles generally held lands of their sovereign, while they were authorised to represent his person over the districts to which they were assigned, administering justice in his name, levying his feudal exactions on his vassals, and receiving their homage. These powerful feudatories were held in check by Charlemagne; but under his successors, and the other European monarchs, it became their aim to be the independent sovereigns of the territories committed to their charge—an object in which they were more or less successful according to circumstances, some throwing off their master's yoke, while others made themselves intermediate superiors between the king and his vassals. The various states of Italy and Germany are illustrations of the working of these events. The feudatories of France made a very near approach to independent sovereignties. They possessed within their own dominions the right of coining money, that of waging private war, exemption from all tributes, except the limited feudal duties by which they acknowledged the superiority of the crown, and finally, freedom from legislative and judicial control on the part of the sovereign and his courts. The vassal, too, in looking after his own concerns, sometimes conquered territories not inferior to those of his lord; and under such circumstances there was little chance of his being an obedient retainer. The Duke of Normandy, the vassal of the King of

and were demanded by the lord caused him outlay. If he had neighbour, or to portion off a re to ransom a son, he demanded a fusely exacted by the knights w sades. To accomplish this, the con- he seller's superior must be had, and according l usage, it is thus signified. In virtue of an y, or "procuratory," a representative of the es to the superior, or his representative, and ymbol of a "staff and baton," as the law-books practically of a pen, the lands are delivered hands of the superior, who transfers them over rchaser by handing the pen to him or his agent. lows an investiture by the superior in the above ich is conducted in virtue of a charter granted o his new vassal. To the superior this is not a barren ceremony, for he receives a year's he property to reconcile him to the change of

THE LAW OF ENGLAND.

id has already been mentioned as an exception eneral prevalence in Europe of the civil and ws; not that these systems were totally re- ut that they met with a countervailing resist- ich prevented them from obtaining the influ- y possessed in other countries. This resistance ound in the existence of a different, and, it aps be said, hostile system, called the common to the power of parliament to make laws or The three great elements of the jurisprudence nd are the common law, the law of equity, and ate law. To these may be added, as codes o particular spheres, the admiralty law and siastical law.

ng of the common law, Sir Matthew Hale, its says: "This is that law by which proceedings rminations in the king's ordinary courts of re directed and guided. This directs the course nts of lands, and the kinds, the natures, and nts and qualifications of estates; therein, also, ner, forms, ceremonies, and solemnities of ing estates from one to another; the rules of acquiring, and transferring of properties; the olemnities, and obligations of contracts; the l directions for the exposition of wills, deeds, of parliament; the process, proceedings, judg- nd executions of the king's ordinary courts of the limits, bounds, and extent of courts, and isdictions; the several kind of temporal offences ishments at common law, and the manner of ication of the several kinds of punishments; ite more particulars, which extend themselves as the many exigencies in the distribution of 's ordinary justice require."

on Law.—The origin of this system, one of the eresting subjects of modern investigation, is in deep obscurity. Its progress, subsequently to n of Edward I., who has been called the English n, is pretty accurately noticed; but when an un- nal inquirer reads those portions of English law- hich attempt to carry the history to an earlier e cannot help feeling disappointed at the unsatis- result. The more marked features of the system ubtless, the customs of the Anglo-Saxons. A n of the laws of England during the heptarchy, of the Anglo-Saxons, was published by an emi- iquary, at the commencement of the eighteenth ; but there is great reason to believe that they itten some centuries after the Conquest, while gments of Anglo-Saxon legislation which they refer chiefly to the arrangement of the military he clergy, and other matters of general or police on, which, in the present instance, are less in- g than a little insight into the laws relating to rights would be. Alfred and Edgar have ac- much fame for having collected and arranged of their predecessors, reformed them where e impolitic, and completed them where deficient; uld be difficult to determine their exact merits. Edward the Confessor enjoys a similar reputation. To him, indeed, history supplies us with good ground for referring equitable laws, for we find that when the people complained against the oppression of the Norman kings, they demanded "the good old laws of Edward the Confessor." It is probable, however, that the compliment did not apply to him so much in the capacity of a legislator as that of the last of the Saxon kings.

Whatever may have been the exact nature of the laws of the Anglo-Saxons, the Conquest effectually incorporated them with the feudal system, and the connexion between vassal and superior became one of the most important features of the common law. It is not to be supposed, however, that this was the earliest visit of feudal institutions to Britain. The Saxons could not well escape the influence of a system which had deeply rooted itself among the kindred nations of the continent; and many feudal institutions are to be found existing under the Saxon kings. The increase of the spirit of feudalism under the sway of William the Conqueror was, however, so great, that many authors have attributed its origin in England to the era of the Conquest. It was then, indeed, that it became oppressive. The conqueror brought with him the system of his own province, for which he was a vassal to the King of France, and could not admit the possession of landed property in England, except as held from himself in the capacity of lord paramount. The greater nobles—chiefly the conqueror's companions in arms—naturally held the lands he liberally bestowed on them of him as superior, and they compelled all who lived upon their lands, or even in their neighbourhood, to acknowledge them as liege lords. The forcible increase of such a system as the feudal law, could not but be attended with acts of great oppression. These were added to by the selfish magnificence of the princes, who cleared large tracts of country of inhabitants, that they might enjoy the regal pleasures of the chase in undisturbed tranquillity. The Saxons had their own county courts, but the greater part of the causes were, after the Conquest, removed from them to be pleaded in the court of the monarch, which attended on his own person. Legal proceedings were conducted in the Norman dialect of the French, which was afterwards changed into Latin. The use of a tongue unknown to the people at large, continued down to the days of Oliver Cromwell, and at the Restoration was restored, with other equally useful practices. It was abolished in as far as respects the proceedings of the courts in 1730.* If we knew nothing of the veneration with which the Saxons looked back upon "the good old laws of Edward the Confessor," the obstinacy with which they preserved their language would have led to the presumption that they had been equally tenacious of their ancient customs. The former outlived every attempt, moral, intellectual, or physical, by reprobation, sarcasm, or force, to extinguish it, and so, to a certain extent, did the latter. The judicial system, and the tenure of land, might both be altered; but to their original customs the people adhered so resolutely, that these were at length blended with the opinions and feelings of their Norman tyrants, and became to a certain extent the system of law which they administered. There was a further leaning on the part of the barons to the popular customs, from this circumstance, that the priests, whom they viewed as

* For many purposes connected with legal practice, Norman continued to be employed—law-books were written, and cases reported in it. The following specimen of a formal document of the end of the sixteenth century, gives a grotesque picture of the manner in which languages were twisted to suit the convenience of those who used them:—

"Fuit resolve per le pluispart de les justices et le counsell del Roigne, cest terme à Sergeants Inne, in presentia comitis Sussex Justic. Forestar citra Trentram, que le building dun novel Mease in le severall soyle on waste dascun home deins un Forest, est un purpresture et noyance al Forest et Game, et finable ou arrentable, pour le tolleration ou permission de ceo destroyer al arbiterment et discretion del justice, ou raceable et destrue al pleasure," &c.

leges are, in a great measure, constitutional, and it has often been said that it was procured for the advantage of the aristocracy, and not of the people; but it is not without stipulations in favour of the latter, protecting them both from the crown and the nobility. It restricts the tyrannical forest laws, and the exactions by feudal lords from their vassals. The clause which has attracted chief interest, however, is that which says that no freeman shall be affected in his person or property, save by the legal judgment of his peers, or by the law of the land. Legal writers have found a stately tree of liberty growing out of the seed planted by this simple sentence. They see in it the origin of that judicial strictness which has kept the English judges so close to the rules laid down for them in the books and decisions of their predecessors. The judgment by peers is said to refer to jury trial, and it is urged that the whole clause strikes against arbitrary imprisonments, and involves the principle of the *habeas corpus*, by which every man, whose liberty is restricted, may demand to be brought before some competent court, that he may be either convicted or liberated. The great charter has always been a favourite object of veneration, both with the aristocracy and the people, and Sir Edward Coke reckons thirty different occasions on which it was ratified.

Civil liberty may be defined as the permission of such an amount of free action as it is most conducive to the welfare of all that each individual should possess. This is one of the most important objects of the laws, and the circumstances which conduce to its existence are among the most interesting in legal history. In England, the progress of liberty has been in a great measure attributed to the division of interests in the country. The crown had an interest in checking the power of the great nobility. That the exercise of this power was essential to the liberty that has existed in England, is apparent in contemplating the state of France and Germany, where the aristocracy made themselves either quite or nearly independent of the crown, and revelled in the tyranny of their despotic wills unchecked. A very important blow to the power of the aristocracy was accomplished by Edward I. in 1290, by the abolition of the system of sub-feuing. From that day, no vassal of the crown could grant lands to be held of himself, as he may to this day in Scotland—he could only put a

ns were not, however, the only means by which es, while adhering apparently to the letter of could adjust it to their own views of the wants y. A far-seeing judge who looked forward to able rise of a new system of transactions, could, ying of the principles of the law that might be perceptible at the moment, adapt them to the encies. It was thus that Lord Mansfield, with-aid of statute, created the law of insurance. re frequently many underwriters, or insurers cy, and had the practice been as it was, each ave had to be prosecuted separately on the of a loss; but Mansfield, by a very slight ce from previous practice, brought all the a policy into one action—an expedient with-h the system as it at present stands could existed. This was accomplished by a rule known by the name of the consolidation rule, all the actions except one is stayed, on the defendants becoming bound to abide by the that action. In their covert efforts to change the judges did not spare even acts of parlia-hey managed to hit a blow at the power of the cy, by limiting the operation of the statute of When the holder of the entailed estate wished he let the buyer bring an action against him, that he had no title. He said he had bought erty from some one—usually the crier of the hose duty it was to support his title. The ng called in, made default, and was nominally to give the holder under the entail an equi-rith whom there was no effectual competitor, e estate was adjudged to the purchaser.

positories of the common law are the treatises nt lawyers and the reports of decisions. Of ier, there are several of the thirteenth and th centuries—Glanvil, Bracton, Hengham, and called Fleta, the authorship of which is un-Lyttleton's treatise on Tenures, the work of a atured system, was long the text-book in the of the feudal law. It was in the humble form ment on this work, that the great Chief-Justice ued the vast treasury of legal learning so fami-own as "Coke upon Lyttleton," a book which lf an almost inexhaustible subject of study to er. The next great name is Blackstone, a man ught elegant accomplishments to bear on the drudgery of the law, and wrote a book, the clear ity of which has made many men acquainted laws of their country who would have other-ained profoundly ignorant of them. The book great defect, that, professing to be not merely ition of the laws but an estimate of their worth, s indiscriminate eulogy on all the vices of the s well as its advantages. The reverential eye ich English lawyers look upon whatever is in the common law, is singularly apparent in rity of law-books. If any great authority, such or Blackstone, has treated of a particular sub-oever afterwards writes upon it seems to be nd to incorporate all that he has said, not only but in words. As the passages are not marked d, the effect is a very peculiar one; for the after perusing a few sentences in the easy flow ineteenth century, finds himself unexpectedly d in the quaint language of the reign of James ut the slightest hint that he is going to get, not ment of the author himself, but something taken ke or Spelman. Of the reports of cases there vast collection. From the time of Edward I. of Henry VIII., they were annually collected rs appointed for the purpose, and were called year-books. They have latterly been published by private reporters. As they are all precedents for guidance in succeeding cases, and therefore the source to which the public look for the interpretation of the laws they must obey, it may be questioned whether they should not be officially recorded by persons responsible for the accuracy of their reports. This plan has, to a certain extent, been adopted in America.

Law of Equity.—The peculiar strictness with which the common law was administered, gave rise to the other great division of English jurisprudence—the law of equity. This was originally a system by which relief was given in cases where a strict interpretation of the common law would have produced injustice. It could look to the influence of accidents and frauds when common law could not. A deed, for instance, was lost. The common law courts could hear nothing about what might have been its contents. They could see nothing, know nothing, act on nothing, but the express words of the deed as set before them, and as that could not be found, the party must suffer. Here the court of equity came to his relief, by compelling a "discovery" of the contents of the document. When a trustee was put in possession, common law could not look at him in any other light but as holding for his own behoof; but equity compelled him to do his duty to his employers. Where an obligation was to pay, common law could comprehend its nature and exact performance, but if it was to perfor many other act, the assistance of equity was generally necessary. Again, the courts of law might give a remedy for a mischief after it had been perpetrated, but they could not interfere to prevent it. This necessary branch of legal administration came likewise within the jurisdiction of the judge in equity, who, on cause shown, could issue his "injunction."

The origin of this system is as obscure as that of the common law, though it is evidently of a more modern date, having been introduced as a remedy to the evils of the latter. The earlier law-books do not mention it, and it was probably long in operation as a sort of exception to the ordinary course of law, before lawyers would acknowledge it as a system. Its most plausible origin is simply this—that when a person suffered a manifest injury, which the ordinary courts could not remedy, he applied for redress to the sovereign in person. The king's conscience-keeper, or chaplain, became the referee on these occasions, and what he did he sealed, by way of testimony of the royal authority, with the king's seal. Hence the origin of the lord chancellor with his great seal, whose office, in this form, has been traced, or imagined to be traced, so far back as the days of Edward the Confessor. In early times, the chancellors were ecclesiastics, and they thus were in the habit of adjusting their equity, and the form in which they administered it, to the civil law. This occasioned great feuds with the common law courts, which at the commencement of the seventeenth century raged so fierce, that in a case where a remedy was sought in equity from the proceedings of the Court of King's Bench, the lawyers who conducted the proceeding, and a master in Chancery, were indicted for an offence. With the assistance of King James, whose legal notions were derived from the civilians, the courts of equity triumphed. The great Sir Edward Coke was then at the head of the King's Bench—a man who, notwithstanding his harsh and tyrannical acts, must still be admired for the bravery with which he supported the strict administration of the law, however high might be the personage who wished to evade it. Whatever may have been the origin of equity, it became at last a fixed system of law. It is a popular mistake that a judge in equity gives his decision according to what is called "the general principles of equity and justice," without reference to strict rules. He is bound down by precedents and rules, and there are many acts of parliament which regulate his proceedings; so that, in reality, equity is but a department of the general system of law.

Statute Law.—We have now to speak of the third branch of the law—statutes, or acts of parliament. The

tain the exact words which it was intended should constitute the act. Singularly enough, the bill is still in the form of a petition, and when it is made an act, all the alteration that takes place is, that the words "May it therefore please your Majesty," are taken out. A bill may be introduced either in the House of Commons or in the House of Lords. It is a rule, that all bills affecting personal station—such as bills of attainder for treason, bills for naturalising foreigners, &c.—shall make their first appearance in the House of Lords. The commons possess the more substantial privilege of originating all bills of supply, or for the levying and appropriation of taxes. The privilege is jealously guarded, and it is usual, should the House of Lords amend such a measure, for the House of Commons to refuse to take it into consideration again, and to authorise their speaker to throw it over the table. About seventy years ago, in the case of a bill for the protection of game, the House of Lords thought fit to raise the penalties higher than those sanctioned by the lower house, and as the money went to the exchequer, the commons considered this an infringement of their privileges, and acted accordingly. All measures involving taxation originate in what is called "a committee of supply," in which the house is presumed to be sitting, not to debate great questions, but simply to transact pecuniary business. In the case of the introduction of any ordinary bill, amending the law, into the House of Commons, the first stage is, to obtain leave from the house to "bring it in." In the House of Lords, a member may move a bill without previously obtaining leave. On a bill being brought in, the next step is the first reading. A member moves that it be read a first time. If there be a party in the house bitterly opposed to the principle of the measure, it may be opposed in this stage, and a debate and division will of course ensue. If the objections be merely to the details, they are reserved for a future opportunity. On its passing this ordeal, the bill is ordered to be printed. The next ordeal is the second reading, after which the bill is referred to a committee of the whole house, to be examined. In this committee, as in a committee of supply, the body is the same in every respect as that which constitutes the House of

ish Courts.—We have now to notice the various
f law in England. The House of Lords must be
ked as a general court of appeal from the whole
m. There is only one set of superior judicatures
hich a reference may not come before it in some
other—the criminal courts of Scotland. The
f parliament is connected with the great council
feudal kings, which gave them advice both in
ve and judicial matters. When parliament was
ed into two houses, the judicial business adhered
ral to the upper, and, probably at the insti-
of the bishops, the Lords adopted the power
inistering oaths, which was not possessed by
mmons—a circumstance which more distinctly
l their judicial character. To bring causes which
ssed through the hands of learned judges under
ct cognisance of a body consisting of clergymen,
, and young men of fashion, would be too prepos-
to be practically adopted; and though the appeal
inally taken to the House of Lords, it is heard
sided on by one of the eminent lawyers, of whom
re always several in the house, and generally
Lord Chancellor. Independently of their powers
ges of appeal, the Peers act as a criminal court
cases where a peer of the realm is tried for a
capital crime. They are formed into a temporary tribunal for the occasion, presided over by a judge called the lord high steward. This official is properly the judge, the peers acting as a jury, and giving their verdict on the question of guilt. The directly feudal origin of this relic of ancient practice will be at once recognised.

The principal courts of first resort, are naturally divided into courts of common law and courts of equity. The former are three in number; the King's or Queen's Bench, the Common Pleas, and the Exchequer. Each has a chief, and four assistant judges, called puisne or junior judges. These courts date their origin to the Conquest. On feudal principles, the Norman kings called all the principal causes which had, under the Saxons, proceeded before the county courts, to be decided in their own hall, or court, by their own great council, which was presided over by an officer called the justiciar. This court, called the *Aula Regis*, or King's Court, at first followed the king's person, a great inconvenience, removed by Magna Charta, which fixed it permanently in Westminster. Under Edward I., the system was adopted of sending deputations from the court twice a-year, to try cases in various parts of the country. Under the same monarch, the jurisdiction of the court was split into three parts. To the justiciar, afterwards called chief-justice, were assigned the pleas of the crown, as they were termed, involving all offences; and being the highest judicial officer in point of rank, his court was appointed to have cognisance over the two others. The matters connected with the exchequer, viz. the regulation of the royal domains, the collection of duties and other taxes, were committed to judges called barons, presided over by a chief-baron. All questions about the possession of land, and other litigations between one citizen and another regarding matters of property, were called "common pleas," and were committed to certain justices, presided over by a chief-justice.

The King's or Queen's Bench is thus the chief criminal court, and the Exchequer is the principal tribunal for revenue matters; but these courts are by no means restricted to the departments to which they are so assigned—they possess, concurrently with the common pleas, a jurisdiction in all ordinary questions of common law. The manner in which they obtained this power is one of the most extraordinary circumstances in the history of the laws of any country. The instruments made use of were, as has been hinted, the fictions, described as a peculiarity of the English law. To get at the real motives which were at work, it is necessary to recollect, that formerly not only the judges, but all the officials connected with the several courts, were paid by fees, the amount of which depended on the extent of business transacted. They were thus like so many tradesmen keeping shops for the sale of justice, each anxious to keep a large supply of whatever was most wanted, and to serve the public on the most tempting terms. In this manner, the courts of law undersold the courts of equity by not demanding any sanction, such as an oath, for the truth of what litigants declared in their pleadings. An arduous run for business was carried on between the three common law courts, the accounts of which, as given in the legal histories and law-books, are infinitely grotesque. The extent to which a court could carry its jurisdiction by these means, depended less upon reason than upon the muscular power of those officers of the court who enforced its decrees. The Exchequer, when it attempted to levy taxes, was told occasionally that the person charged with them could not pay, by reason that his debtors had not paid what they owed him; while he hinted, that if the Exchequer wished his money, they had better assist him in recovering it. On this, it became the practice of the Exchequer to assist those who were in debt to the crown to get payment of the money due to them. It occurred to some ingenious lawyers, employed to recover debts, that if they stated to the Court of Exchequer that certain clients were debtors of the crown, and could not pay by reason of their own debtors not satisfying their

demands, the court would make very little inquiry into the truth of the statement, but would adjudicate in the case, and levy the money forthwith. The court made so little inquiry as to the truth of the case, that it would not allow the statement to be contradicted, however inaccurate it might be; and down to the year 1832, when one brought an action in the Court of Exchequer, it was a matter of form that he should say he was a debtor to the king, and that he could not pay his debt, unless an obligation, incurred in his favour by the defendant, were fulfilled. The jurisdiction of the King's Bench was limited to cases that were either purely criminal, or had some connexion with offences. When any one, however, happened to be in the prison of the King's Bench for an offence, there was no means of getting at him but through that court; and so the plan was devised, of stating that a man was in the King's Bench prison when he was not. "And in process of time," says Blackstone, "it [the Court of King's Bench] began, by a fiction, to hold plea of all personal actions whatsoever, and has continued to do so for ages: it being surmised, that the defendant is arrested for a supposed trespass, which he never has, in reality, committed; and, being thus in custody of the marshal of the court, the plaintiff is at liberty to proceed against him for any other personal injury, which surmise of being in the marshal's custody the defendant is not at liberty to dispute." These fictions were not abolished until the year 1832, when, by act of parliament, an uniform process was established in the three common law courts. An appeal lies from the decision of any one of these courts to the judges of the other two, who, when met to decide on such appeals, constitute a court called the Exchequer Chamber. Fourteen of the fifteen judges who form these common law courts hold the assizes in the various county towns—in some of them twice, and in others thrice a-year. Here they act both as civil and criminal judges. Offences committed in London and its vicinity are tried by a tribunal lately created, called the Central Criminal Court.

The origin of the authority of equity tribunals has been already considered. The principal establishment of this description in England is that of the Chancery. It has in it three distinct courts, and three judges—the chancellor, the vice-chancellor, and the master of the rolls. Formerly, all proceedings in bankruptcy centered with the lord chancellor, but the increasing importance of this class of business rendered it necessary to appropriate a separate court to the purpose. This was accomplished in 1832 by Lord Brougham's act. The term Bankruptcy is in England confined entirely to persons engaged in commerce; and the jurisdiction of the court is so limited. Previous to its formation, however, it had been found expedient to create a court for the relief of insolvent debtors who might not be engaged in trade, on their giving up their property to their creditors. By Sir John Campbell's act for restricting imprisonment for debt, the practice of relieving insolvent debtors was improved, nearly on the model of the Scottish system of *cessio*, and a bankruptcy code was applied to debtors who might not be tradesmen. The utility and importance of the Insolvent Debtors' Court were thus materially enlarged. Another court was lately brought into existence, called the Judicial Committee of the Privy-Council. It consists almost entirely of the judges of the other courts. Its principal jurisdiction is in appeals from the colonial courts, and the Court of Admiralty. This Court of Admiralty has jurisdiction in maritime contracts, and crimes committed on the high seas. Having to deal with matters in which the inhabitants of this and of other countries are jointly interested, it professes to follow, not the special law of England, but the general commercial law of modern Europe, founded on the Roman law. In time of war, the court receives a commission to adjudicate regarding prizes taken from enemies, or from neutrals committing breaches of neutrality. Besides all the tribunals already mentioned, there are ecclesiastical courts in the two archiepiscopal provinces of Canterbury and York. In the former, there are
of Arches, the Prerogative or Testamentary
the Court of Peculiars; in the latter, the
Court and the Chancery Court. There are
inferior ecclesiastical courts. The chief
exercised by these tribunals, besides
siastical discipline, is in matters relating to
to moveable goods. If we were to complete
English tribunals, it would be necessary to
justices of peace, who, besides many
in revenue and other matters conferred by
liament, sit, at the general and quarter-
judges in minor offences. Then there are
of greater or less jurisdiction, connected with
boroughs; and, in some places, establishments
courts of requests, for adjudicating in
debts.

After having detailed the legal system of
it is unnecessary to describe that of Ireland,
almost in all respects a model of it. The
system of England was lately ingrafted on
the empire, and the principles of the improved
Debtors' Act were extended to it in August

earliest superior tribunals in Scotland, were
he parliament, as the king's great council, or a
ee of it, acting with the delegated powers of the
body. There was likewise, as in England, a
usticiar, whose authority was vast, and not very
ined, especially in criminal matters. Committees
ament were, in the fifteenth and the beginning
ixteenth century, sometimes formed into regular
of justice, in which, however, a certain degree
ination could not be avoided. In 1532, the pre-

sent Court of Session was constituted, on the model, it is believed, of the parliament of Paris. The chancellor, whose principal duties disappeared at the Union, was chairman of this body. It consisted of fifteen judges, including a president, who was chairman in absence of the chancellor. In 1830, the number of judges was reduced to thirteen; and about the same time, the authority of some other tribunals, the chief of which were the Courts of Admiralty and Exchequer, was transferred to the Court of Session. It consists of two divisions, which are separate tribunals. Some of the judges also act as individual judges in courts of their own, in which capacity they are termed "lords ordinary." An ordinary case, on coming into court, is discussed before a lord ordinary, from whose decision there is a reference to one of the divisions of the "Inner House," as it is termed, where the remaining judges sit collectively. From them there is an appeal to the House of Lords. There is no such conventional distinction as that between law and equity known in Scotland, and hence English lawyers, who are apt to measure all other systems by their own, absurdly enough speak of the Court of Session as a court "both of law and equity." Besides the usual adjudication of litigated cases, there are two very useful descriptions of action peculiar to this court. The one is called an action of "declarator," which a person who is puzzled about any difficulty, and is afraid of committing an illegal act, may bring, to have the law as to the point declared, and his course of action made plain; another is called a "multiplepoinding," which may be raised by a man having money in his hands which more than one person is claiming, that he may know to whom he can legally pay it. Trial by jury was not, until very lately, added to the jurisdiction of this court. It is limited to certain descriptions of cases, and is far from popular.

The principal criminal court is the Court of Justiciary, consisting of seven of the judges of the Court of Session, who sit in Edinburgh, and commission some of their number to hold circuits in the country. Almost all offences in Scotland are prosecuted by a public prosecutor; there is no grand jury, and the ordinary jury, consisting of fifteen, give their verdict by a majority. The criminal law is partly statute, partly founded on long usage. There are many offences which, by this latter portion of the law, are punishable with death, if the prosecutor do not restrict the extent of punishment to be awarded, which he now does in almost every case except murder. The sheriffs, or local judges of counties, have important judicial powers, both civil and criminal. The former extends to every description of dispute regarding property, except what refers to land. The powers of these judges have lately received extensive additions, especially in matters of insolvency and bankruptcy. They do not employ a jury, except in criminal cases, in which their power of inflicting punishment does not exceed imprisonment. They hold small-debt courts, where questions of debt to the amount of £8, 6s. 8d. are summarily decided. The magistrates of royal burghs enjoy powers somewhat analogous to those of sheriffs. The authority of the justices of peace in Scotland is not so extensive as it is in England.

There has latterly been some indications of the assimilation of the legal usages of Scotland to those of England, and it is highly desirable that an end should speedily be put to all existing diversities.

THE FRENCH CODES.

The ancient laws of France were a mixture of the civil, feudal, and canon law. Partly they were the doctrines of the authorities on the civil law, and partly they were the ordinances issued by the various monarchs. By far the greatest portion, however, in bulk, consisted of the peculiar feudal customs of the various provinces. In these the feudal system was sometimes retained in so high a state of purity, that the collections of provincial customs are esteemed excellent authorities on the subject. But it was not merely in each province that there was a local custom. The power of the crown,

great families, who thus constituted a species of professional nobility. The decrees of these bodies were often baffled or reversed by the royal authority, exercised in the well-known form of *lettres de cachet*. These alterations of the decisions of the courts, however, were performed not as a judicial revision, but by the simple authority of the king; and thus the parliaments, being subject to no judicial control or responsibility, adhered but slightly to fixed rules of law, and often acted according to their own will and discretion. The jury, even so much of it as may have existed under the old feudal form, had entirely disappeared, and proceedings were conducted in secret. Criminal investigations, instead of terminating in a conclusive trial as in England, were protracted through a lingering succession of written pleadings and secret investigations, from which the accused could never calculate on being free. The torture was extensively employed; but in the general case, only when there was as much circumstantial evidence as would justify a conviction in this country.

The whole of this system was swept suddenly away before the tide of the revolution, but amid the troubled times that succeeded, it was long ere rulers could find peace and leisure for the erection of a substitute. In 1800, Napoleon appointed a commission to draw up a project of a civil code. The project when prepared was circulated for comment and suggestion, and was afterwards, along with the observations made on it by the different courts of law, discussed in the council of state and the tribunate. Thus was formed the *Code Civil*, or civil code of France, more generally known by the term *Code Napoleon*, which was applied to it under the empire. Nearly at the same time, and in the same manner, was framed the *Code de Procedure Civile*, or code for regulating the form of process in civil actions, and specifying the jurisdictions of the various courts. Being a subject more connected with technical detail, and involving less of general principle than the civil code, its provisions were left almost entirely to the arrangement of the lawyers. Besides the technical directions in which lawyers are almost wholly interested, there are in this manual many which concern the ordinary procedings of citizens at large, such as directions for the order to be taken regarding the effects of a deceased person, &c. This code is generally accompanied

ONOMY.

re gold than it does to procure silver. They give
h larger amount of iron in exchange than of silver,
se the labour of procuring silver is much greater
the labour of procuring iron.

d hence we see that when men exchange with
other, the exchangeable value of any thing will
general, as the labour which it costs to procure
fence the *cost* of any thing, or its *natural price*,
labour which is necessary to produce it.

s, however, is liable to accidental and temporary
ation. Sometimes a much larger quantity of a
product is created than is wanted. In this case,
wner, in order to induce persons to buy, will offer
a less price than the cost, because he had rather
at a loss than lose it altogether. When, in
ase, the supply is too abundant, the exchangeable
will fall. On the other hand, when not enough of
iven product has been created to supply the wants
community, the buyers, rather than be deprived
will overbid each other, and thus will pay more
the natural price: that is, when the demand is
ally great, the exchangeable value will rise. These
s of fluctuation can, however, exist but for short
s, and the constant tendency of the exchangeable
of any thing will be towards the cost of the labour
sary to create it.

Production.—Production is the act by which we
o any object its particular value, or its particular
ity to gratify human desire. Man can neither
nor annihilate any thing; he can only change the
of that which is created. We cannot create iron,
can extract it from the ore; we can then change
steel; we can change a lump of steel into knife-
s. Each of these acts, by which a particular value
en to the iron, is called an act of production.
substance in which any value has thus been
, is called a *product*.

ital.—The term capital is applied to the material
it has been changed by labour into a product; to
struments with which this change is effected; to
eans of subsistence by which the labourer is sup-
l; and also to the product which results from the
ation of labour to the raw material.

Exchange.—Every man finds it for his interest to
exclusively at one kind of production. Thus, we
at every man has his own trade or profession.
man wants a great many other things besides
which he produces himself. The shoemaker pro-
shoes; but he cannot eat, or drink, or clothe him-
ith shoes. Hence he must exchange his shoes
se articles which he needs. Every other man is
condition of the shoemaker. And hence we see
n immense amount of exchanges must be made
day in every civilised community.

ribution.—Not only does every man work at a
ular trade—it is commonly the case that a great
men must labour together in order to complete a

particular product. Every penknife, nay, every pin, goes through the hands of several workmen, and receives a portion of its value from every one of them. When the product has been created, every one is entitled to his share of it. The principles by which this division of the profits is made, is called by political economists *distribution*.

Consumption.—Every product, after it has been created, is put to some purpose. Sometimes it is used for the creation of some other product; as wheat, when it has been raised, is used for the purpose of making flour; or, again, it may be used for the simple purpose of satisfying human desire, as bread, when it is eaten, is used to appease our hunger. The destruction of values in this manner is called *consumption*.

The whole subject of Political Economy may therefore be comprehended under these four divisions—Production, Exchange, Distribution, Consumption.

PRODUCTION.

Production is the act by which we confer upon any object a value which it did not possess before; or it is the application of *labour* to *capital* for the creation of a product.

OF CAPITAL.

Capital is the *material* which is to be united with industry for the creation of a product, or the *instruments* which are used in the act of production, or the *necessaries and conveniences* by which the health of the labourer is sustained. Sometimes the labourer finds the material in its native state, as the miner finds the ore or the coal in its native bed; most commonly, however, he receives it from some one who has already conferred upon it some value, and it is his occupation to confer upon it another.

The forms of capital are as various as the different occupations of men. The *material* of the farmer is seed, manure, animals, &c.; that of the manufacturer, cotton, wool, iron, leather, &c.; and that of the merchant, the various substances in which he traffics.

The *instruments* with which these producers labour are very various. The farmer uses ploughs, harrows, and carts; the manufacturer, saws, hammers, and spinning and weaving machines; and the merchant, ships, boats, locomotives, &c.

Besides these, all men require for their *sustenance* food, clothing, shelter, and the various conveniences of life. Viewed in this light, all capital may be included under one or the other of these classes.

Changes of Capital.—Inasmuch as the labour of men is so universally employed in changing capital having one form of value to capital having another form of value, capital must be incessantly undergoing changes. It is no matter how many changes it undergoes, if its value be by every change sufficiently increased to pay for the labour which it cost to effect it.

Increase of Capital.—If a given material undergo a change by which its value is increased, then there is an increase of capital equal to the *difference* between its former and its present value. I say equal to the *difference*, because, in the creation of one value, another value is always destroyed, and we are benefited, therefore, only by the superior amount of value which we possess over that which we have consumed to produce it. Thus, the farmer consumes seed, manure, labour, sustenance, in the production of a crop. He has changed one kind of capital for another, and he is enriched by as much as his crop is of greater value than all that it cost him to produce it.

Capital which is undergoing change by which its value is increased, or which is yielding an annual income, is called *productive capital*. That which is lying idle, and neither producing any thing nor increasing in value, is called *unproductive capital*.

Money forms a small but very important part of the capital of all civilised nations. The use of money is to enable us the more easily to make exchange other. That it forms but a small part of a country, is evident from the fact, that part of the wealth of any individual consi What is true of all the separate individu munity, must be true of the whole comm tively.

Of Fixed and Circulating Capital.—That which the owner derives profit by changing place, is called circulating capital; while instruments which he uses to produce this from the use of which he derives profit capital. Thus, the wheat and the manures of the wool and raw cotton of the manufactur circulating capital; the ploughs, harrows, land of the one, the machinery and build other, are their fixed capital.

There is a constant tendency in a prosper tion of society, to change circulating into fi The farmer sells his wheat, and with the pr more land and better tools, or erects better barns. The manufacturer, with his profits e enlarges his manufactory; and thus, in the p society, vast sums are annually invested in ma manufactories, and various means of practica ment.

The beneficial result of this tendency is o Fixed capital is but slowly consumed, and wealth of each generation is transmitted to and, year after year, a country becomes b better provided with the means for furnish with all the conveniences of life. The supe veniences which we enjoy in this country, w enjoyed by the aborigines who long ago occup owing entirely to the amount of fixed capi covers the soil. It is thus that the results o dustry of men are transmitted to their poste that the men of any one age are enabled to rea tage from the skill and good conduct of the m ages who have gone before them.

OF INDUSTRY.

Of the Nature, and the different Kinds of Human In

Industry is human exertion of any kind u for the creation of value.

If we consider the different kinds of value is in the power of man to create, we shall human industry may be employed in three ways. Matter may be changed in its *elements* as it is by the farmer when he plants seed an increase; or in its *aggregate form*, as wh penter fashions a piece of furniture out of a its *place*, as when a sailor carries it from one to another. The ultimate design of all human employed in production is to effect either o other of these results. They are frequen minated agricultural, manufacturing, and c industry.

It is evident that every one of these kinds is absolutely necessary, in order to promote nience and happiness of man; and also that could prosper without the aid of the oth there no agricultural labour, every body w Were there no manufacturing labour, every be chilled to death. Were there no labour transporting commodities from place to pl could enjoy any convenience except what h duced himself; that is, though, with great suffering, a few persons might live, yet they w few, and these few would be miserably poor. see how unwise it is for any jealousy to ex the farmer, the mechanic, and the merchan equally necessary to each one, and each o sary to both the others.

But some men are neither mechanics, n nor merchants; they are students, or philo lawyers, or physicians, or clergymen. A men, however, are necessary to society, in

be generally obvious, and are as well entitled to rewards as any other useful class.

The Increase of the Productiveness of Human Industry by the means of Natural Agents.

the productiveness of human industry, we mean nount of product which a human being, in a given can create. Thus, if a farmer by one day's labour ise one bushel of wheat, the productiveness of his is equal to one bushel; if he can, with the same , raise two bushels, the productiveness of his is equal to two bushels. If a cotton-spinner can ne pound of cotton in a day, this is the amount of oductiveness of his labour; if he can spin ten s, this is the amount of it.

r, it is evident that the greater the productive- f labour, the better is it for the industrious person or all his neighbours. Every one knows that tter for a farmer to own rich than to own poor because, with a year's labour on the one, he can a much larger crop than on the other. It is, wer, better for him that his neighbours also have rich than poor land, because the richer land, the larger quantity of *their* products will e able to give him in exchange for *his* products. e only difference between rich and poor land is, ich land renders industry *more productive* than and.

e case is the same with the other modes of industry. ho spins with his fingers, without any machine, s very unproductively; that is, in a day he can but a very small product. He who labours with ning-wheel, labours much more productively; that h a day's labour he can create a much larger nt of product. And he who uses a still better ine, called a spinning-jenny, labours yet more pro- ely; that is, in a day he can create twenty or a ed times as much product as he could with a ng-wheel. In every case, as the productiveness our increases, both the labourer and the commu- ity benefited, just as a farmer would be benefited changing a poor soil for a rich one. In both cases nefit is the same; that is, with a given amount our he creates a larger amount of product, he es better wages for his labour, and at the same the community obtains his product at a cheaper

d hence it is that mankind have been, from the st ages, endeavouring to invent means by which oductiveness of human labour may be increased. he condition of mankind is improved, from time e, just in proportion as these endeavours have ade successfully. Every one knows how much forts of an industrious mechanic in this coun- eed those of an uncivilised Indian. And the ce is owing to the fact, that the labour of the e *much more productive* than that of the other.

e there are two ways in which the productiveness an industry may be increased: these are, first, *of natural agents;* and, secondly, *division of*

tural agent is, as its name imports, an agent of or any quality of things which we are able to use to accomplish our purposes. Thus, it is of the of wood, when set on fire, to give off heat, and the natural agent which we use for the purpose king our food. It is of the nature of steam, when to expand, and, when suddenly cooled, to con- and hence steam is the natural agent by whose e expansion and contraction we create the force we need to propel boats or machinery. So it is nature of water, when falling down from an ele- to acquire a very considerable force; this force natural agent which we use to turn the wheel of So, the peculiar quality of the magnet is a l agent. The various qualities of medicinal are also natural agents, though used for a diffe- rpose from those mentioned above.

l or a *machine* is any instrument by which we are enabled to avail ourselves of the qualities of natural agents. Thus, an axe is an instrument by means of which we make use of the cutting power of iron. A steam-engine is an instrument by which we make use of the expansive and contractile quality of steam.

In political economy, the principal use of natural agents is either to create or to use power or force, or, as we sometimes call it, momentum. Thus, if a man wishes to row a boat, or chop wood with an axe, he must have strength or power with which to do it. The more strength or power he has, the more work he can do. Thus, a man can do more work than a boy, because he has more strength, or power, or force, to do it with. Now, natural agents are capable of exerting this power, and, by means of machinery, we can direct the manner in which it shall be exerted.

The natural agents which we use for this purpose are of two kinds, animate and inanimate.

Animate natural agents are beasts of burden and draught, as the ox, the horse, the ass, the camel, the elephant, &c.

That these very greatly increase the productiveness of human labour is evident. Every one knows how much more land a farmer can cultivate by means of a pair of horses, than he could by his own unassisted strength, and how much more wheat a man can transport from one place to another with a waggon and horse, than he could carry on his back.

The inanimate natural agents are, as we have said, the various qualities and powers of things by which we are enabled to accomplish our purposes. The most important of these are gunpowder, wind, falling water, and steam.

Gunpowder is used in war, in hunting, and in the blasting of rocks. For the latter purpose it is very valuable in the construction of canals, railroads, &c.

Wind is used as a stationary agent in the common windmill; and as a locomotive agent in the propelling of vessels on the water. It is cheap, and for some purposes very valuable.

Falling water is used very extensively as a stationary agent in almost all works where great power is required. Almost all our nails are made, our wheat is ground, and much of our cotton is spun and woven by water.

Steam, however, is now used the most extensively for the various purposes of the arts, as it possesses many advantages over every other agent. It is capable of exerting any degree of force, from the least to the greatest; it may be used as a stationary or a locomotive power; it may be used on land or on water, and it may be placed perfectly under human control. Its only disadvantage is its expensiveness. Steam is now used to spin the finest thread and the stoutest cable, to weave muslins and to hammer anchors, to propel the largest vessels on our rivers and on the ocean, to draw our carriages, to saw and plane our boards, and, in fact, to accomplish almost all the purposes which require either great or unremitted force.

Inanimate agents are in general preferable to animate agents, in most of the purposes for which power is required. The reason of this will be easily seen. For instance—

1. *They are cheaper.* A steam-engine of a hundred horse power will cost less than the horses necessary to do the labour which it performs, and will cost much less to keep it at work.

2. *They labour without cessation*, while animals require much time for rest and refreshment.

3. *They are safer.* They have no passions, and hence may be governed by fixed and certain laws. A steam locomotive is neither liable to run away nor be frightened.

4. *We can use them without the infliction of pain*, while animals frequently, of necessity, suffer in consequence of hard labour or rapid driving.

5. They are capable of much more rapid action, hence there is a great economy of human time.

But this is not all. Men are able not only by the above means to create force, they are also able to de-

In this manner much human labour is saved, or a given amount of labour is rendered much more productive. Were it not for this quality of type-metal, every type must be cut by the hand. This would render types and books very expensive. But now we have only to cut a mould into the form that we wish, and, if the melted metal be poured into it, the type is formed, by cooling, into the precisely corresponding figure. In this manner a single workman can make several hundred types in an hour.

There are various other qualities of things which we use in like manner, but their number is so great, that we have no room here to describe them. By reflection, every person may easily furnish himself with as many examples as he pleases.

Of Division of Labour.

In the preceding sections, we have seen that the productiveness of human labour may be greatly increased, *first*, by discovering the various qualities of things, or, specially, those qualities by which we are capable of creating force; and, *secondly*, by those various contrivances by which the force thus created may be directed and applied. We have one other source of increased productiveness yet to consider—it is division of labour—and its results are, in many cases, as striking as any that have been noticed.

Division of labour, in general, means employing one individual upon one kind of labour, instead of employing the same individual upon several kinds of labour. If we reflect, we shall see that this circumstance forms one of the great differences between savage and civilised nations. A savage does for himself whatever he requires to have done. He is his own philosopher, inventor, and operative; his own farmer, butcher, baker, shoemaker, tailor, carpenter, &c. And the result is, that he is ignorant, hungry, shelterless, almost naked; and that he continues, age after age, without making any improvement. On the contrary, civilised men divide these various occupations, so that one man labours wholly in one, and another man labours wholly in another employment; and the result is, that civilised men, without labouring more than savages, easily obtain convenient shelter, clothing, food, and all the necessaries of life.

But still more. Every one who observes any mecha-

by the same individual, he mu
tools, or pass from the use of
use of another. This occasions a
performing the same operation
tools with the same adjustmen
purpose perpetually. This is a
the adjustment of tools requi
expense, as, for instance, in the
furnace. If the smith heat it, a

highest price. By division of la
can employ just the amount and
that he needs. This greatly red
tion.

The effect of all this is seen
at which almost all the articles
obtained. For instance, suppo

Again, the practicability of division of labour
is upon the capital of an individual or of a coun-
A man must have accumulated some considerable
it of capital before he can carry on division of
in any occupation. For instance, suppose that
vision requires the labour of ten men, he must
materials and tools sufficient to employ them
Nor is this all: suppose that it take ten days to
his product, he must have material sufficient to
y them during all this time, before he receives
ing in return for that product. And if it take
night more before he is able to sell his goods
btain a fresh stock of material, he must have a
l sufficient to employ them during this time also.
for this reason that manufactures do not com-
with the first settlement of a country, but they
always be delayed until capital accumulates, be-
hey can be successfully established.

Division of labour can only be carried on where
is sufficient demand for a product to consume it
as it is manufactured. If it would take *ten* men
nufacture pins by division of labour, but only so
pins could be sold as could be made by *one* man,
our could not be divided. This, however, de-
upon several other circumstances. For instance,
mand depends upon the number and the wealth
mmunity. There is a larger demand for hats
wn of ten thousand inhabitants than in a village
hundred inhabitants. There is a greater demand
s among a thousand rich men than among a
nd beggars. This is another reason why division
ur and manufactures naturally increase with the
, and age, and wealth of any country.

Hence we see why roads, canals, and railroads
beneficial to the industry of a country. By re-
the cost of transportation, they render the price
commodity as low at one hundred miles distance,
equently was before at ten miles distance, from
e of its manufacture. Hence they increase the
of consumers, and, by thus increasing the de-
render practicable the division of labour in cases
before it was impracticable.

n, it is evident that demand must be greatly af-
by the cost of the article manufactured. Costly
are purchased only by the rich. But the rich
a small part of the community. Hence the
for such articles is but small. It is those
that every one wants, and that every one can
at create such a demand as will enable them
ade at the cheapest possible rate. Hence we
division of labour, and the reduction of price
occasions, benefits the poor much more than it
rich. I do not suppose that jewellery, trinkets,
es, are much, if at all, cheaper than they were
or thirty years ago; while cotton cloth, hard-
oollen goods, and all the manufactured necessa-
life, have fallen in price from one-half to three-
. This is an immense benefit to those of us who
ged to spend our money for necessaries and
s, and have none to spend for trinkets.

The Benefits of Increased Productiveness of Labour.

bject of labour, as every one knows, is to pro-
e means of happiness. A farmer labours to pro-
heat, rye, fruits, &c.; a cotton manufacturer to
e clothing, and a shoemaker to produce shoes,
of any other case.

, the greater the productiveness of labour, the
are the means of happiness which the individual,
ven amount of labour, produces. If a farmer
a year's labour upon a rich soil, his labour is
productive than if he expended it upon a poor
at is, with the same labour, he produces in one
o hundred bushels of wheat, and in the other
ly two hundred bushels. Every one sees that
an advantage; and every one would rather own
ndred acres of good soil than one hundred acres
soil.

a if a poor soil can, by means of manure, or in any other manner, be changed into a good one, the result is the same as if, by means of improved tools, a farmer were able, by one day's labour, to produce twice as much as he could produce before.

Now, this principle applies just as much to a manufacturer, or any other labourer, as to a farmer. Suppose a carpenter, when he first commences learning his trade, could not make more than one table in a week, his labour would be very unproductive. As he becomes more and more skilful, he can make a table in less time; and at last, when he can make a table in a day, his labour is six times as productive as it was before, and he has the means of procuring for himself six times as many comforts with the same amount of labour. If he be able, by means of a turning-lathe, or a steam-engine, or by division of labour, to make two tables a-day, his labour will be still more productive, and he will be able to procure for himself a greater amount of conveniences.

So, if men spun by hand and wove by hand, were this possible, a man could produce but very little thread and very little cloth. His labour would be in the lowest degree unproductive. But if he invent a spinning-wheel and a loom, his labour becomes at once vastly more valuable, and he can produce ten or twenty times as much as he could before, and he is able to provide himself with a much greater portion of the necessaries and comforts of life. If, now, we furnish him with a spinning-jenny and a power-loom, his labour will be still more productive; and as he creates, with a given amount of labour, a greater amount of the means of happiness, a larger portion will fall to his own share, that is, he will be both richer and happier. And the facts show that such has always been the result. The labour of the Western Indian or the Eastern Hindoo is without machinery and without division, and it is of course very unproductive. Hence *he* is very poor. The whole wealth of the Indian is a blanket and a bow and arrows, and the whole wealth of a Hindoo is a pot of rice and a cotton cloth. How different is the condition of the labourer in this country!

And we also see that it is not beneficial merely for one individual to increase the productiveness of his labour; it is beneficial to the whole community that the sum-total of industry should be as productive as possible. Would it not be a benefit if the crops of corn, and wheat, and cotton, and rice, the products of the fisheries, of the mines, and of the manufactories, during the next year, should, with the same labour, be doubled, so that we might, by a day's labour, procure twice as much bread-stuffs, fuel, clothing, and every necessary and comfort of life, as we are able to procure at present? Now, the whole effect of the increased productiveness of labour, by means of machinery and of division of labour, is to bring about precisely such a result.

And yet more—the benefit of this change is specially realised by the labouring classes. A nobleman in Great Britain is by no means as much better off than his ancestor, as a common labourer in England now is better off than a serf at the period of the feudal oppression and ignorance. The rich and powerful in all countries always have an abundance of comforts and luxuries. They are but slightly benefited by improvement in the productiveness of labour. It is the labourer who is chiefly benefited, because every improvement brings within his power some convenience which was before out of his reach. What difference does it make to a man worth a hundred thousand a-year whether coal costs one or five pounds a-ton, and cotton cloth fourpence or two shillings a-yard. At either price he would be able to procure an abundance. But to the man who is worth but fifty or a hundred pounds a-year, the difference of price is a matter of immense consequence; inasmuch as at one price he would be able to supply himself abundantly, and, at the other price, he would be able to supply himself but very scantily, if he were able, indeed, to supply himself at all. Hence we say that improvements in machinery, by which the productiveness of labour is increased, are specially for the

benefit of those of us who are obliged to work for our living.

The only objection to all this is, that, by increasing the productiveness of labour, we diminish the demand for labour, and that hence labourers are thrown out of employment. This deserves a brief consideration, inasmuch as it has led not only to erroneous views in theory, but to practical wickedness in action.

To settle this question, let us examine the facts. What are the manufactures which now employ the greatest number of workmen, and in which the number of workmen has, within the last twenty years, the most rapidly increased. I think that any one will answer, the cotton and the iron manufactures. But if we were asked in which branches of manufactures has labour-saving machinery been most extensively introduced, we must also answer, the cotton and the iron manufactures. Or we may come to the same result, if we compare the linen with the cotton manufacture. Machinery has been introduced only in a small degree into the manufacture of the one, and very extensively introduced into that of the other. The consequence is, that the labourers in linen are very poorly paid, and are diminishing in number, while the labourers in cotton are well paid, and are every year rapidly increasing. These facts are abundantly sufficient to teach any person what is the natural result of the use of machinery.

The reason of this is easily seen. Suppose that only 10,000 yards of cotton *could be used* in a given district, and it required 100 men to make them. If these 10,000 yards could be made by fifty men, it is evident that fifty men would be thrown out of work. But suppose that, by this change in the mode of labour, the cotton cloth which was sold at two shillings could be sold at one, so that *twice the quantity* could be used, and 20,000 yards were wanted, there would be a demand for just the same number of workmen as before, so that the workman would be just as well off as he was before. But suppose that, when cotton was at two shillings a-yard, only those worth two hundred pounds a-year could afford to purchase it, while, now that it is at one shilling, those worth only one hundred pounds per annum can become purchasers. The number of persons in a community worth one hundred pounds a-year, is more than double that of those worth two hundred. Hence this class alone would create a demand which would place the labourer in as good circumstances as he was before. But to this must be added the demand of those worth a hundred and twenty, a hundred and fifty, and two hundred pounds; and it must be remembered, that each one of these classes will now use more cotton cloth than the class of two hundred did formerly. To this must be added the fact, that by the reduction of price, cotton cloth may be used for many purposes to which it could not formerly have been applied. All these circumstances taken into the account, will show us how it is that the greater the productiveness of industry, the greater will be the wages of labour; and, that the more extensively labour-saving machinery is introduced, the greater will be the demand for labourers.

But this is not all. While the labourer is thus benefited in his wages by the use of machinery, he, and every other person, is equally benefited in another respect. We have seen that, by this means, every product is rendered cheaper. Every one knows how much cheaper woollen and cotton goods, carpets, books, and most of the necessaries of life are, than they were a few years since. Not only are they cheaper, they are also better and more elegant. Calicoes, crockery, the various fabrics for wearing-apparel, paper-hangings, and many other things, may be procured at a very reasonable price, and of great beauty of appearance. These benefits the labourer shares with the rest of the community. Hence his share of the advantage is doubled. His wages are raised, and the price of what he purchases with them is reduced. The rich man receives no higher interest for his money than before, that is, his wages remain the same; his only advantage is, that, with the same money, he can procure what he wants at a cheaper rate.

OF CONDITIONS OF SOCIETY FAVOURABLE TO PRODUCTIVENESS.

It is essential to the promotion of indust man should enjoy the reward of his labour man must be allowed to labour as diligently and to use all that he has gained, provided it it innocently.

For these purposes it is necessary that al perty in a community be divided. By this is that every thing belong exclusively to some the first place, the land must belong to partic sons, otherwise it will not be tilled at all. this principle strikingly illustrated in the rud country inhabited by savages, and also in th most *commons*, wherever these exist. No on any particular interest in the cultivation of a a country occupied by savage tribes, no par vated. Were any one to cultivate a patch of g he might have his right to the crop disputed, the benefit of his labour. It is impossible fo exert industry under such circumstances. common, again, no one has so great an inte induce him to keep the ground in order; he pieces of ground generally become nearly w useless. The principle may be still more f illustrated. Suppose a cherry tree growing in row, and no one's property in particular. N be at any pains to protect the young fruit of from the birds by means of network; and wo which the birds spare will be taken before it idle children. There will be no public bene kind from such a cherry tree. But suppose become somebody's property. It will then for and protected; and the fruit in due tim ripe, and become a source of enjoyment as will go.

It is not enough that property be divided; of property must also be *protected*. By th property, we mean the right which any man what is his own. Thus, if a man make a ta his own materials, he has a right to keep that to sell it, or to use it as he will, and no one h to take it from him, or molest him in any w the use of it. And it is the same thing if bought the table, or procured it in any honest by exchange.

Now, it is the business of every man in th nity to see that no man interferes with any ot property. This is what we call the protecti right of property. The whole community h mitted this power to the legislators, judges, are called the government. Hence we see tha special business of government to protect i from violation of the right of property.

The right of property may be violated by in as in the cases of robbing, stealing, house-brea Were this allowed, no one would labour at al no one would labour for the sake of seeing his plundered and wasted by thieves and robb case is the same when property is plundered stroyed by mobs. If a man would not labou sake of seeing his property destroyed by one would not labour any the more for the sake his property destroyed by five hundred robbe

Hence it is clear that the industry of a co pends very greatly upon the goodness of its la faithful execution of them. If laws allow of of property, all men would soon become thieve of labourers, and as thieving produces nothi would soon be nothing left to steal, and all wou And if the laws be not put into execution, the as well be no laws, and the result would be th

But governments themselves sometimes vi right of property. This is the case, when, by will of the government, the property of the i is taken for any purpose whatsoever. Such is

nay despotic governments. When this is the case, ple becomes at once dispirited and indolent. Who d labour on the soil through a whole summer, if he that he was liable to have his harvest seized in anmun by a tyrant, as soon as it was fit to be ared? Thus we see that the most fertile regions of arth, when under such a government, lie almost tivated; the inhabitants are few, and these few xtremely poor. Hence the importance of a good itution of government.

t suppose that every man be allowed to gain all he can, he must also be allowed to *use it as he will*. is evident, because no man will be industrious to property, unless he be allowed to use it for the otion of his own happiness in such way as he likes

man's property are his faculties of body and mind, s means of industry, and his property or capital. necessary, in order to render men industrious, they be allowed, provided they do it honestly, to both of these as they choose.

r instance, the labourer should be allowed to work y trade or as many trades as he pleases, to work y place that he chooses, and to change his occupa- whenever he supposes it can be done for his ad- age; he should also not be obliged to change it s he believe such change will be for his benefit. It be supposed that every one understands his own ess better than any one else can understand it for and, therefore, to oblige him to make any change rary to his own wishes, will do him an injury, and jury which is wholly without excuse.

ed the same is true of *capital*. Every man that any thing has a right to use it as he pleases. No whether an individual or a government, has any to direct him in the manner in which he shall em- it. A farmer has a right to raise just such a as he pleases; and a merchant to buy and sell he chooses, and at such prices as he sees fit. He ask too much, and may impose upon his neighbours, f he do so, he will soon punish himself. And though ets wickedly, yet, as we cannot control him without fering with the right of property, it is much better him alone, than, for the sake of regulating *him*, to ess *all the other men* in the community, and thus, the sake of punishing *one* bad man, to injure *a ired* good men.

nother condition of society favourable to produc- ess, is the intelligence of the people. If they be rant, they neither are sensible of the importance dustry, nor know how to exert themselves advan- ously. It thus becomes of great consequence that hould be, to a certain extent at least, enlightened nowledge.

EXCHANGE.

e have thus far considered production, and the s by which, with a given amount of labour, pro- on may be increased. But were this all, the hap- s of man would be but in a small degree increased. e a man to make every thing for himself, or, what e same thing, have nothing but what he could himself, though his labour were ever so produc- he would enjoy but very few comforts. Though a er, instead of raising a hundred bushels of wheat, d raise three hundred bushels, yet if he did not for his own consumption more than a hundred, ould not procure any thing else with his addi- l two hundred, he would be no better off than e, but might as well suffer this additional product t upon the ground. His additional labour would him no additional advantage, and hence there d be no encouragement to labour. But as soon e is able to exchange this two hundred bushels than he can use himself for some other things ch he wants, his additional labour brings with it rresponding reward; and additional productive-

ness of labour brings with it additional comforts and conveniences. Of so great advantage to mankind is exchange. And hence it will be seen that the prosperity of a country, its wealth, and its industry, are very much in proportion to its facilities for exchange. Thus we see that no country can easily grow rich without good harbours on its coast, good roads or canals in its interior; and that its advantages are greatly increased when it is so fortunate as to be penetrated in many directions by navigable rivers. We shall now proceed to consider the nature and principal laws of exchange.

OF THE FACTS IN OUR CONSTITUTION WHICH RENDER EXCHANGE UNIVERSALLY NECESSARY.

1. It is a well-known fact that labour is necessary, in order to render any thing valuable. Every thing valuable around us will, if we reflect, be seen to be the result of the labour of some one. And we have also seen, that he who has laboured has, by means of his labour, acquired a right to the value which he has created. By this we mean that he has a right to do with it just what he pleases.

2. It is also the fact, that every man seems disposed to pursue some one kind of occupation in preference to another. One man chooses to be a sailor, another a farmer, another a mechanic, another a manufacturer, and another a merchant. And we also see, that these different men seem each one to be the best adapted to that kind of business which each one has chosen. And we know that, by the principles of division of labour, there will be a much larger amount of product created when every individual has a separate employment, than when every man is obliged to divide his time between a dozen employments.

3. But while every man is thus intended to labour at one particular employment, and to produce one particular thing, every man needs for his comfort and convenience *a thousand* things. Now, as he labours to produce only *one* of these *thousand* things, he must procure all the rest by exchange; hence, in order to gratify his desires, he must make nine hundred and ninety-nine exchanges. By so doing, he is able, by labouring, to produce one kind of value, and then by exchange to supply himself with every kind of value that he wishes. In this manner men are rendered happier, inasmuch as every one is enabled to pursue the occupation that he likes best, and, at the same time, to procure whatever he needs for his happiness. And, moreover, as by this mode labour is much more productive, every one procures a much larger quantity of what he desires by the same amount of labour.

We thus see, that in order to secure our physical happiness, there is really as great a necessity for *exchange* as there is for *production*. This rule applies equally well to nations as to individuals. No nation is able to raise within itself one-half of the productions necessary to its convenience. It may have, however, peculiar advantages for producing some one or two articles of general necessity. These are commonly called its staples. Now, it is for the advantage of a nation, as well as of an individual, to devote itself to the production of that which it can produce in the greatest abundance and with the greatest ease, and then to procure by exchange with other countries those articles which it needs, but which *they* produce with greater ease and in greater abundance. The benefits in this case are of the same nature as in the other. Each nation labours in that department of production that it chooses, and at the same time, by so doing, it is enabled, in greater abundance, to avail itself of the productions of every other country.

Since there is so great an amount of exchange which must of necessity be made, it is evident, from what we have said on the subject of division of labour, that there will be a great saving of labour, that is, the labour of the whole society will be much more productive, if some portion of the community devote their time to the business of conducting exchanges.

sale merchants.

Retail merchants purchase in large quantities of importers or wholesale merchants, and sell again to consumers in such quantities as they may desire. In doing this, they greatly benefit all parties. The wholesale dealer could not afford to break open a barrel of sugar to sell a pound, unless he charged a very high price for his trouble. The consumer could not afford to purchase a bag of coffee, or a barrel of sugar, or a whole piece of broadcloth. And, besides, a man is rarely a judge of the goods he wishes to purchase, and it is much better for him to use the skill of a good judge, than to attempt to judge for himself.

The *wholesale merchant* imports in large quantities from abroad, or purchases in large quantities from the manufacturer at home, and sells to the retail merchant, who, as we have said, sells to the consumer. The importance of this kind of labour in exchange is as evident as the other. The retail merchant could not import from abroad, in so small quantities as he wishes to purchase, unless with much additional expense. One wholesale merchant could import as much as would supply a large number of retail merchants, and with but very little more labour than would be demanded of every individual who only imported the small quantity which he needed for his own sales.

The interest of the merchant requires that he should buy as cheap as possible, that he may sell as cheap as possible; for the cheaper he sells, the more numerous will be his customers. Hence the wholesale merchant will export what he can export cheapest, will exchange his export where he can do it the most to his advantage; that is, where he can procure what is most wanted at home, and where he can do it at the lowest rates. So, the retail merchant knows that the better his goods are, and the cheaper the rate at which he sells them, the greater will be the number of his customers, and the greater the number of exchanges which he will be able to make in a year.

Hence we see that the real interest of the merchant, and that of the whole community, are the same. The retail merchant can become rich in no other way than by purchasing as cheap as he can, that he may be able to sell as cheap as he can; for if he sell dearer than his neighbours, no one will buy of him. And so

labour will, by competition, be
every other capital, no more th
recompense.

While this, however, is true

roductiveness of industry.—It is not enough that
be desirous to exchange; he cannot gratify that
nless he be able to offer something to the other
hich will be accepted in barter. If I desire a
f flour ever so much, I can never obtain it, unless
le to offer to the flour merchant something which
accept in exchange for his flour. Thus, every
ws that a rich man is able to make a great many
changes in a year than a poor man. A labourer
ns high wages can make many more exchanges
r than a labourer who earns but low wages. A
buys many more articles of comfort, that is,
nany more exchanges, in a productive than in
oductive season. And thus, in general, every
t see that a rich country makes more exchanges,
ternal and external, than a poor country; a
ous, than a declining country; and the same
in a period of successful than in a period of
ssful industry.

ral character.—Men do not always exchange
oducts at the same instant, but one or the other
ly waits some time for the return which he is
e in exchange for his product. This gives rise
ility to dishonesty. And, besides, where men
onest, they will frequently cheat each other in
ntity or the quality of the article which they
exchange. Now, where these liabilities exist,
l greatly lessen the number of exchanges. No
o can help it, will have any dealings with a
Hence, when men are disposed to be rogues,
es will diminish. Laws are made to oblige
to act like honest men; hence, when laws are
l are well administered, exchanges will be more
than when they are unjust, partial, and unfairly
tered. But every one must see that on the
haracter of a people, not only their personal
, but also the goodness of their laws, depends.
ve observe that morality, using this word in its
tended sense, is of the greatest importance, not
success in production but also to success in
es.

he same principles apply to our exchanges with
rs. If we treat them justly and kindly, and
em all reasonable means for enforcing their
hey will come and exchange their products for

nce of a country will, in due time, produce the
fect on exchanges generally.

diminution of production during a single year
duce the same effect for that year; and oppres-
avy taxation, or any thing which interferes with
ion, or diminishes the productiveness of human
r, will accomplish the same result perma-

hence it is that, as a nation becomes vicious,
or oppressive, such moral deterioration must
a diminution of exchanges, in the same manner
errupts all other kinds of industry. And thus

success in exchange, as well as success in production, depends much upon the intellectual and moral character of a people.

From what has been said, it will be easy to perceive in what manner a government can best *promote* the business of exchange. It is by promoting the intelligence and virtue of a people—by giving every facility for the increase of the productiveness of industry—by encouraging, in every suitable manner, the establishment of roads, canals, railroads, and means of internal communication—by rendering its harbours and coasts as easy of access as possible—and by giving to foreigners every reasonable facility for the transaction of their business when they come amongst us.

And we see, also, what measures are, in their nature, most likely to *diminish* the number of exchanges. Such are duties on imports, or, in other words, adding to the price of every foreign commodity offered in exchange, obstructing the means of intelligence, refusing the necessary facilities for constructing means of internal communication, imposing unnecessary disabilities upon foreigners, neglecting the condition of harbours and coasts, and, in general, any course of measures by which the article offered in exchange is rendered more expensive, or by which the person who comes among us for the purposes of exchange, is denied any reasonable means for seeking his own interest or happiness.

[Of exchange by means of money, metallic and paper, a full exposition is presented in the sheet entitled, COMMERCE—MONEY—BANKS, to which we refer.]

DISTRIBUTION.

We have thus far considered the mode in which wealth is, in the first instance, produced, and in which, in the second instance, the producers are enabled to exchange it with each other.

It is, however, commonly the case that an article of production is not the result of the labour of one man alone, but of several men united. Thus, several men successively unite in producing a barrel of flour. One owns the land, another sows the seed, another reaps the harvest, another owns the mill in which it is ground, another manages the mill for the owner, another makes the barrel in which it is contained, another transports it to market, and another sells it to the consumer. Now, every one of these must be paid out of the barrel of flour when it is purchased by the consumer; that is, the price of the flour must be so *distributed* among them all, that each one has his just share of the proceeds. The principles on which this is to be done are considered by political economists under the head of DISTRIBUTION.

As all value is the result of capital and industry, it is manifest that we shall comprehend the whole subject, if we treat of *Wages*, or the price of labour, and *Interest*, or the price of capital. Inasmuch, however, as *Capital in Land* is in some respects peculiar, we shall consider it separately, under the head of *Rent*, or the price of land.

OF WAGES, OR THE PRICE OF LABOUR.

Of the General Principles by which Wages, or the Exchangeable Value of Labour, is regulated.

We have already seen that exchangeable value is the cost of any thing, influenced moreover by the effect of supply and demand. We shall therefore consider, 1st, The cost of labour; 2dly, The effect of supply and demand upon it.

I. Of the cost of labour.

Of simple labour.—By simple labour we mean that labour which may be performed by any healthy person without any, or with very trifling, previous education.

1. But it is evident that no person can continue in health without food, clothing, and shelter. We cannot, therefore, procure the labour of any living thing without furnishing those necessaries which are required for

different climates. In warm climates, where vegetable food is principally used, and where very little expenditure is required either for fuel, clothing, or shelter, wages would naturally be lower than in cold climates, where the expenditures must of necessity be so much greater. This is, however, equalised by the fact, that warm climates enervate the system and relax the physical energies, so that, while you pay a very small sum for a day's work, you receive a very small amount of labour in return.

Such is the natural cost of simple labour, and it will be generally found that by this rule that cost is practically adjusted. Whatever may be the condition of the country, the lowest class of labourers earns but simply sufficient to procure the ordinary necessaries of life for the parents and the children.

Of educated labour.—But for most of the occupations of life some sort of education is required. No man can be a carpenter, or a blacksmith, or a jeweller, or a physician, or a lawyer, or a clergyman, without being educated for the particular calling which he intends to pursue. Now, this education is expensive. It costs both time and money. If a man wish to practise a trade or a profession, he must spend several years in preparation or apprenticeship. During the whole of this time he receives no wages, and frequently is obliged to pay for tuition. When he has acquired the necessary skill, he is able to perform more valuable labour than before, and he is entitled to a higher compensation. This compensation would naturally reasonably be adjusted by a consideration of the time and capital which he has expended in his education. The longer the time and the greater the expense of his training, the higher ought to be his wages. It is evident that the wages of such labour must be always greater than those of simple labour, otherwise it will not be produced. No man will spend money in educating his son for a calling which will yield him no higher wages than he could earn without any education.

Such are the principles by which the cost of labour is adjusted. Wages must always be sufficient to support the labourer, and to remunerate him for the expense which must be incurred in acquiring the skill

he same principles in the main govern the supply
dicated labour. If the wages of such labour are
cient to pay for the expenditure of time and capital
ssary to the acquisition of the education, such
ur will be produced; that is, men will turn their
and talents in this direction. On the contrary,
the remuneration of such labour is inadequate,
will not prepare themselves to perform it, and
e already educated will devote themselves to some
r occupation. The supply will thus be reduced so
correspond with the demand.

Circumstances which affect the Rate of Wages in particular Instances.

We have seen that a given amount of capital is neces-
in order to furnish employment for an individual
urer. Hence any given amount of capital directed
ny one business, will only furnish employment for
rrespondent number of labourers. And hence, if
portion of the capital now employed in any one kind
usiness be withdrawn and devoted to any other
of business, there will follow a change in the rate
ages in that employment. The wages in the busi-
from which capital is withdrawn will fall; those in
business to which capital is directed will rise. Such
e result of all legislative enactments which affect
employment of capital.
ut, besides this more general cause, the price of
or in the several professions is affected by various
ial circumstances. For instance—
By the ease or difficulty, the pleasure or pain, of
employment, and by the estimation in which it is
by the community.
When any trade is in its nature unpleasant, men do
like to practise it. Hence, when we wish to employ
n, we are obliged to overcome their reluctance by
ier wages. When the performance of the labour
leasant, many persons are willing to engage in it,
hence, the supply being greater than the demand,
price of the labour falls accordingly.
. By the skill required in performing the operation.
his results from two causes. First, the greater the
required, the smaller will be the number able to
form the operation. Thus the supply will be small.
, secondly, the longer will be the time spent in
ning to perform it, and hence the greater wages
the labourer be entitled to receive.
. The confidence reposed. In many employments,
h reliance must be placed in the moral character,
courage, the discretion, and forethought of the agent.
, inasmuch as these qualifications are not frequently
nd united in the same individual, the number of
able candidates for such employments is small.
nce, as the supply is commonly less than the demand,
wages in such employments are high. And, inas-
ch as those who have a large amount of capital at
s, find it for their interest to procure such labourers
ny price, the wages of such persons will always be
ch higher than in cases when no such confidence is
ecessity reposed.
. Constancy or inconstancy of employment.
ome kinds of labour furnish incessant employment;
ers furnish employment only at intervals. Yet, in
one case as well as in the other, division of labour
uires that the labourer devote his whole time to his
iness. Hence, in the latter case, it is reasonable
t, for the performance of a particular operation, he
uld receive a larger remuneration than in the for-
r. We pay more for riding a mile in a hackney-
ch than for riding a mile in a stage-coach, because
employment in the one case is constant, and in the
er inconstant. A large portion of the time of the
ver of a hackney-coach is consumed in waiting for
sengers. For this time we must pay our portion
enever we employ him.

OF THE PRICE OF MONEY, OR INTEREST.

Why we pay Interest for the use of Money.

The first question which arrests our attention in the consideration of this subject, is the following:—Why should the use of money have any price at all? As I return to a man the same value which I borrow of him, why should I pay him any thing for having kept it during the interval? This question we shall first attempt to answer.

Every man who labours at any regular employment, possesses two qualities which render his services of value—these are *strength* and *skill*. The first enables him to execute simple labour, or labour of the cheapest kind; the second, when united with it, enables him to execute educated or higher priced labour. But, in order to perform the latter, he requires tools and materials, that is, capital. Without these, he could perform only simple labour. Of what use would be the skill of the blacksmith, without a forge and iron? or that of the carpenter, without tools and wood? or that of the spinner, without a spinning-jenny and raw cotton? Without these, they would be all reduced to the necessity of that labour which could be performed with their naked hands.

Suppose now that I am a blacksmith, and own a forge, tools, and iron, with which I am daily employed, and thus earn the wages both of labour and skill. Were I to lend them to another man for a week, and carry a hod during the mean time instead of working at my trade, and thus lose the profit of my *skill*, he who thus borrows them of me should surely remunerate me for the use of them. Suppose he borrow them for a year, he should pay me for the same reason. And if I have the money with which he can purchase them for himself, and I lend it to him, he should pay me just as truly for the money as for the tools and capital, because if I had not lent it to him I could have established another forge, which I could have made profitable to myself.

And here we may remark, in general, that when we speak of the loan of money, it is in reality not money but other capital that is wanted, and for which we pay interest. Were a tradesman to keep the money which he borrows locked up in his drawer, it would be worth nothing to him. It can be only of use when it is exchanged for something else, which, being united with labour, will yield a profit. The fact is, that every one, as soon as he procures money, exchanges it for tools, or materials, or merchandise. Every one sees that these ought to pay interest, because they are the means of accumulation. Just as much should the money pay interest which is exchanged for them, and for which the owner of the money would have exchanged them, if he had not lent it to another

Now, it very frequently happens that the ability to labour is possessed by men who have no capital upon which to employ it. And, on the other hand, capital is frequently possessed by men who have neither the skill nor the ability to labour. In such a case, it is manifestly for the interest of both parties to form a copartnership, the one party furnishing the labour and skill, and the other furnishing the capital. By this means both parties are benefited. The labourer earns the wages of labour and skill, instead of those of simple labour; the capitalist derives an income from his property without diminishing it, instead of being obliged to live upon the principal.

Now this takes place in two ways, both the same in principle, although the mode in which the arrangement is made is dissimilar.

The first is the case of wages. Here there is virtually a partnership formed between the capitalist and the labourer. The one furnishes the tools and the material, and takes all the risks of the operation, and divides with the labourer the profits, which he pays in the form of wages. These are generally agreed upon at the commencement between the parties, and are the same whether the operation be profitable or unprofitable. This, however, is not always the ca whale-fishery, the crew of a vessel receiv proportion of the profits, in the place of reg and of course their remuneration is grea according to the success of the voyage.

The second case is that in which the la sumes the risk, receives all the profit h borrows his capital from the other, agree him at a stated rate for the use of it. Th monly the case in the borrowing and lending If I purchase a shop and stock it with employ another to keep it for me, paying h tomary wages, I act in the first-mentioned m I lend him the money by which he purchase and stock, and he trades on his own risk, interest on the amount borrowed, I act in t manner.

It is the latter case that is to be consider place. Here the borrower uses the capi lender for his own advantage, and that adv equal to the difference between simple labour a united with skill. Did he not thus employ th the lender would employ it himself. It is just that he should pay for the advantage gains, and of which he, by thus gaining it, de owner.

Of Various Circumstances which affect the Rate of

We have thus far endeavoured to show tha that is, interest, should justly be paid for th capital. But we find that the interest of different in different countries at the same t in the same country at different times, and in country and at the same time it is differen rent kinds of investment. To the circumstan give rise to these differences let us now attend

I. The rate of interest will be affected by th tiveness of capital.

When a capitalist, by the use of his own ca readily make ten per cent. per annum, he will charge a higher interest upon it than when scarcely make five per cent. per annum. It evident, on the other hand, that the borrow willing to pay a higher interest in the former the latter case, because he will be able to make profit by the use of it. Hence, when land is ha and productive, interest will be high, becaus vestment of capital and labour in land and m will be exceedingly profitable. The same re rates in other cases.

Whether the productiveness of capital be small, supply will affect the rate of interest the supply is small, there will be a competiti the borrowers, and the lender will receive th possible share of the profits, that is, interes high. When capital is abundant, there will b petition among the lenders; interest will fal the lender will receive the smallest shar profits.

Both of these causes tend to produce the of interest so commonly observed in new Land is cheap. It is in its highest state of All labour bears a very high price, for the labour are imperatively demanded; and, at time, capital is scarce, while the demand for i sant. As a country grows older, these circu change, and the interest of money gradually f

II. Secondly, another circumstance affecting of interest is the *risk* of the investment.

When a man parts with his property and in the power of another, there is at least a ch he shall never see it again. This risk shou be added to the price which is paid for the use Thus, suppose that the fair compensation for of capital in one case were five per cent., on position that it was perfectly sure; if, in anot there were a risk equal to two in a hundr being totally lost, this two per cent. for the ri be added to the five per cent. for use, and th

al one of which is, that he is entitled to his per-
f whatever profit may arise from the operation.
shares are called *stocks*, and are transferable at
oment; the holder, whoever he may be, receiv-
interest, or, as it is called, the *dividend*, at the
r times of payment.

prices of these stocks rise and fall with the
f interest which the undertaking pays. If any
purchased at one hundred pounds a-share, pays
gular rate of interest, it will sell for a hundred
, and then it is said to be *at par*. If it pay
the regular rate of interest, and is perfectly safe,
sell for two hundred pounds a-share, and is then
to be one hundred *per cent. above par*. If it pay
lf the regular rate, it will sell for but fifty pounds
e, and is said to be fifty per cent. *below par*. And
ny other instances.

ks, like any other investment, vary in price with
gree of risk to which they are subjected. If a
ay a high dividend, but yet is liable to be entirely
ed by casualties, it will sell for less than another
g lower interest, but of which the principal is
. Thus insurance and steam-boat stocks, though
ay large dividends, never bring a correspondent
because of the losses to which they are unavoidably
d. On the contrary, though an investment at
t pays but little, yet is expected at some future
o be very valuable, it will bring a high price, on
t of the anticipations which are formed concern-
It is by such circumstances that the rise and
stocks are determined. They are constantly for
large cities, and their prices will rise and fall
e hopes and fears, the anticipations and appre-
s, of the buyers and sellers.

OF THE PRICE OF LAND, OR RENT.

have remarked, in the preceding section, that
or any other investments, will bring a price in
rket in proportion to the annual interest which
derived from them. A stock, let it have cost
may, which produces six pounds a-year, if six
nt. be the regular rate of interest, pays the inte-
a hundred pounds, and it will sell for a hundred
. If it yield twelve pounds, it will sell for two
d pounds, and so in any other proportion.

, the same remark applies to the rent of land.
cre of land, after paying the ordinary expendi-
r tillage and carrying the produce to market,
ld three pounds profit, it will sell for fifty pounds,
ing the rate of interest to be at six per cent. If
fit that may be derived from it be more, it will
more; if less, it will sell for less. And the same
le applies to land, whether it be used for tillage
dwelling-houses.

is the general principle on which the rent of
pends. It is, however, to be remembered, that
ductiveness of land depends upon two circum-
, *fertility* and *situation*.

rtility.—Every one knows that there exists great
ce in the fertility of land. With the same cul-
n, an acre, in some situations, will yield twice or
imes as large a harvest as an acre in other situ-
Some lands require annual manuring, others
need to be manured at all. Now, inasmuch as
n acre in the one place, you can derive three
s much income as from an acre in the other, it is
able to suppose that the former would sell for
imes as much as the latter.

situation.—The products of land, however, are
and it costs a very considerable portion of their
greable value to transport them to the market.
ice of transportation is always to be deducted
he farmer's profit, and tends, by so much, to
the value of his land. It is on this account that
ds, canals, and other means of internal improve-
confer so great a benefit upon a country. They
the disadvantages of situation by reducing the
transportation.

ring these principles in mind, it will be easy to

perceive in what manner rents will be adjusted in any given country. When a territory is at first settled, the land may be had for nothing. Every one being at liberty to choose for himself, the most productive lands, that is, the most fertile and those most favourably situated, will be at first selected. These will bear no price and will yield no rent, because they may be had for nothing.

When, however, these are all occupied, and others are needed, the land of the next inferior fertility will be put under tillage. As soon as this is done, the first class of lands will yield rent, and will command a price. Suppose lands of the first class to have produced fifty bushels to the acre, and lands of the second class but forty bushels. It will be as cheap for the settler to hire a farm of the first class, at a rent of ten bushels to the acre, as to have a farm of forty bushels to the acre for nothing. When the lands of the second class are all occupied, those of the third class will come into request; and as soon as these are tilled, those of the second class will also command a price and will produce a rent. At the same time, the price and the rent of lands of the first class will be doubled. In this manner, the rise of price and of rent in lands of various grades of fertility will go on increasing, until all the land worthy of cultivation is occupied.

As the common market for agricultural products is on the sea-coast, it might be supposed that the price of land would gradually diminish as you remove into the interior, until its disadvantages of situation reduced its value to nothing. This would be the case were it not for various counteracting circumstances. Among these are the following:—

1. The fertility of land, in many instances, increases as we retire from the coast. This fertility counterbalances the disadvantages of situation.

2. As a country advances in civilisation, its means of internal communication improve, and the inconvenience of situation is more and more removed.

3. As a country becomes settled, towns and cities grow up in the interior, and thus bring a market to the farmer. He is as much benefited by the bringing of the market *to him*, as he would be by the removal of his land to the market.

4. Sometimes a new invention in the arts transforms at once the conditions on which the progress of a country depend. Such was the result of the introduction of steam navigation on the waters of the Mississippi and its tributary streams. This invention opened this whole valley to the Atlantic, and gave to the towns on the banks of the river almost the advantages of a position on the sea-coast.

Besides these general circumstances, on which the price of land depends, some others may be mentioned which are well worthy of notice. Man is endowed with a love for the beautiful, as well as with an intellectual and moral nature, and he very commonly takes these tastes into account in choosing for himself a place of abode. Hence, land which is handsomely laid out and tastefully arranged, whether in a village or in the country, will sell for a higher price than that which possesses none of these recommendations. A farm or a dwelling-house, in a well-cultivated neighbourhood, where the people are virtuous and benevolent, will find more purchasers, and of course will sell for a higher price, than one of equal fertility where the inhabitants are ignorant and vicious, quarrelsome and malicious. Hence we see that were men to consult nothing but their own interests, they might very reasonably devote more care than they commonly do to embellishing their grounds and supplying themselves and their families with the means of intellectual and moral improvement.

Land, however, is not always used for the purposes of agriculture. It is used in cities and towns, merely to afford space for the erection of storehouses and dwellings. In this case, of course, its fertility is of no consequence, and its only value depends upon its situation. Hence, its price will be determined merely by *this* circumstance. Those portions which afford the greatest facilities for business, will comma
est rent; and those which recede from th
mand a lower and lower rent, until they
so far from the centre of business, that th
valuable for dwelling-houses. The value
gradually diminishes, until situation is but
of the price, and the land may profitably
gardening. Here the element of fertility
into the computation. The land immedia
large city, is thus commonly occupied by
supply the market with recent vegetables a
a small distance beyond, it is devoted to
purposes of agriculture, and becomes what
perly denominated the country.

Having thus considered the general prin
which the distribution of the profits of any
is effected, we shall close this section by a
illustrating the manner in which these pri
rate in an individual instance.

We will take, for the sake of this illustra
of bread. A farmer in the West Riding of
devotes his land to the raising of wheat.
land, raises his crop, and sells it to the mi
price which he receives for his crop repays
cost of his own labour, the wages and sup
workmen, the cost of manures, the rent of hi
interest on all the capital which has been inv
he own the land, he receives the rent him
hire it, he pays it to the landlord. The mil
the grain, manufactures it into flour, transp
Hull, and sells it to the flour-merchant. T
which he sells it, repays him whatever he ha
farmer, and remunerates him for the cost
the flour. This must be sufficient to enab
pay his various workmen, to remunerate hi
own labour and skill, the use of his capital,
and tear of his mill, and the cost of transp
Hull. What he has paid the transportation
be sufficient to remunerate him for the use of
boats, the men and horses that have been em
navigating them, the expense of tolls, and th
on all the capital which is employed in the
The flour-merchant buys the flour, and keep
storehouse to supply his customers. He
to a sum sufficient to repay him for what he
miller, and also to interest on his investment,
neration for his labour and skill, and the cost
room. The baker purchases the flour of
merchant, and makes it into bread. He ch
his bread sufficient to repay him for what he
flour-merchant, and for all his labour and e
turning the flour into bread. Thus, when we
a loaf of bread, we pay our proportion of all t
ral expenses. And these several amounts, in
instances, are distributed according to the ru
we have laid down. All the labour which
employed is paid according to its value and
all the capital according to the use and risk
had been subjected. The various items of co
production of any article of use, may be easily
in a similar manner.

CONSUMPTION.

OF THE NATURE AND DESIGN OF CONSUMPTI

We have thus far endeavoured to show in w
ner the various objects for the gratification
are *produced*, in what manner they are
among the producers, and in what manner th
which each one of the producers is entitled, is
to each of them.

But we know that all this is done with ref
another object. Every thing that is of an
designed to be used, and after it is thoroughly
in familiar language, *used up*, it is worthless.
previous operations only prepare the way for
tion, and it is consumption that creates the
for their being incessantly repeated.

of bread become mouldy through neglect, its
e as thoroughly consumed as if it had fallen into
e the moment after it had been baked. Vege-
matter decays—animal matter putrefies—the
s are corroded; and thus consumption is conti-
going on, by which the values which we create
e destroyed, unless we watch over them with
nual vigilance. Childish, imbecile carelessness is
h to render any man poor, without the aid of a
positive vice.

Consumption is either *rapid* or *gradual*. The con-
tion of wood for fuel is rapid. The consumption
axe with which we chop it, or of the fire-place
ich we burn it, is gradual. But the one is going
certainly as the other; and hence, in estimating
penses, if a man wish to estimate them correctly,
e must be taken into the account as well as the
. If a man build a house and occupy it for ten
, the gradual consumption has materially dimi-
d its value. If, now, at the close of this period,
imate the value of the house at its original cost,
ll greatly overrate his property. The same is true
niture, and of every thing else which we use.

need scarcely be remarked, that the annual con-
tion of an individual is the total amount of values
he consumes, whether in his business or in his
. Unless his annual production be sufficient to
e the whole of his annual consumption, he will
debt. By as much as his annual production ex-
his annual consumption, he will be growing
. Hence, the object of every thrifty man is to
r this excess as great as possible.

Of the Design of Consumption.

design of consumption is easily seen. Inasmuch
sumption is the destruction of some value, it is of
ature of an infelicity. We never therefore con-
, but with the expectation of procuring some
er good than that which we annihilate. This good
e of two kinds. First, we consume one value for
ake of procuring another and better value; or,
dly, we consume a value for the sake of gratifying
appetite or desire, that is, for the sake of increas-
ir own personal happiness.

Consumption for the sake of the increase of value.
this manner the farmer consumes seed, manures,
r, and tools, that he may thus be enabled to pro-
a harvest. The manufacturer consumes raw
n, labour, machinery, &c., in order to produce
. The mantua-maker consumes calico, thread,
es, and labour, in order to produce a new dress.
thus, in all the various occupations of men, mate-
of every kind, and labour, are consumed for the
of creating some article of use, or convenience, or
y.

Consumption for the sake of the gratification of —Some of our desires have respect to our life,
ealth, and comfort. Such are the desire for food,
ing, shelter, and the various conveniences by
the heat of summer and the cold of winter may
odified. Others are merely for the gratification of
nses, without any regard to the benefit which we
e beyond that of simple sensual pleasure. Such
e desires for the luxuries of the table, of dress,
ages, and for those modes of living which are de-
ed by fashion. Some of our desires are gratified
tellectual pleasures, and others by the pleasure of
good. It is not necessary that I should enume-
ll the various modes of expenditure. In general
consume the value which they appropriate, and
at remains is the gratification which they produce.

OF THE DIFFERENT KINDS OF CONSUMPTION.

sumption is of two kinds, *individual* and *national*.
idual consumption is of two kinds, first, for the sake
reduction, and secondly, for *gratification*.

Individual Consumption for the sake of Reproduction.

design of the consumer in this case is the repro-
n of capital, in some form different from that

in which the capital is consumed. He would gladly produce without consumption, were it possible. But to do so is contrary to the law of his being. Consumption is necessary; but if a man be wise, he will consume as *little* as possible. Production is his remuneration, and if he be wise, he will render this as *great* as possible. His whole gain is the amount by which his production exceeds his consumption. The greater this excess, the greater will be his profit. The rule by which he should therefore be governed, is *to create as large a product as possible, by the consumption of as small a value as possible.*

The consumption of a producer is of two kinds—of capital and of labour.

Of Consumption of Capital.—The principles which should govern us here, are, I suppose, the following:—

1. The consumption of capital should be as *small* in amount as is consistent with the creation of the desired product. A shoemaker, who habitually cuts up a side of leather so carelessly that leather sufficient for one pair of shoes is wasted, will never grow rich. The farmer who sows two bushels of seed when one would have answered as well, loses the half of his seed. In China, sowing is always done by drilling instead of broadcast. It has been computed that, by this method, as much grain is saved as would feed the whole population of Great Britain. The useless expenditure of fuel in Britain is enormous. It is supposed, and with good reason, that not more than one-tenth of the heat of the fuel employed is rendered available in a common fire-place.

2. Capital of no *greater value than is necessary* should be employed to create the desired product. Thus, it is for the interest of every producer to ascertain in what manner he may be able to accomplish his purpose, by the consumption of the least valuable materials. The merchant inquires before he imports a product from a foreign country, with what export he can procure it at the cheapest rate. So the manufacturer, if he be wise, will keep himself informed of the progress of science and of the arts, that he may learn in what manner a cheaper article may be substituted for a dearer in the creation of his product. A fortune has frequently been realised by the discovery of a cheaper dye-stuff, or the substitution of a single cheaper material in the place of that ordinarily in use.

3. *Every utility* possessed by the material consumed should be rendered *in the best manner available.* Thus in an oil-mill the flax-seed from which linseed oil has been expressed is a valuable food for cattle. After the brewer has extracted the saccharine matter from barley, the grains, as they are called, are valuable for the same purpose. The tan bark, after the tanning matter has been extracted, is valuable for fuel. This economy of materials is very well illustrated in the manufacture of combs. In a well-conducted establishment of this kind, every part of the horn, the core, the body, the tip, the shavings, the fat, and the mucilage, are all turned to some available purpose.

Nor is this all. The values which are consumed should be *consumed to the very last.* Thus, in the working of a steam-engine it is necessary to evolve a great amount of caloric, and this is the most expensive part of the process. Now, economy demands that this caloric should be produced at the least possible expense, and that having been produced it should be used for every purpose that it can be made to serve. But every one must have perceived, by the flame which escapes from the chimney of a furnace, that a very large portion of the caloric evolved is absolutely wasted. A very great economical improvement has of late been made in some of the iron-works in Great Britain. This caloric, which was formerly wasted, is used to heat the air which is blown into the furnace. By this expedient a very great saving of fuel is accomplished.

Consumption of Labour.—As labour is expensive in the same manner as capital, economy teaches us to consume precisely as much of it as is necessary to accomplish our purpose in the best possible manner.

1. We should employ no *more* labour
sary. Too many labourers will always
other in idleness. When there is one ma
tell stories, the time of several others mus
in listening to them.

2. We should employ no *less* labour tha
When, from want of a sufficient number
one labourer is obliged to perform ser
work, we lose the advantage of division o
also expose ourselves to all the inconveni
fusion and disorder.

3. We should employ labour of no high
is necessary.

In any extensive operation it will be s
flection that some parts of the process r
skill and attention than others. Some
labour worth five or ten shillings a-day,
labour worth not more than eightpence or
a-day. It is of great importance in any lar
ment so to arrange the labourers that n
shall be employed at a higher price than
which he performs is actually worth. It i
to be remarked, that an error may exist of t
kind. It is as bad economy to employ too c
dear labour. In the one case, we lose by
high a price for labour, in the other, by th
tion of materials, which always results fro
of skill in a labourer.

4. The labour which we have paid for sh
performed. Time is money, to him at least
money for it. If it be wasted, his money
away; and by throwing away money no on
came rich.

In order to secure this result, several th
however, be attended to. The most importa
is, that he who employs labourers should
superintend his own affairs. No one will tak
interest in our own concerns as ourselves.
cannot be done, the establishment should be s
as to ensure full and vigilant superintend
every part, and under such responsibilitie
bring a knowledge of any delinquency to the
the competent authority.

Besides this, much time is saved by system
larity. When one is obliged to wait for anot
labour is of necessity wasted. Tools should a
in the best possible condition. This saves t
takes away one of the most common excuses
gence.

Consumption for Gratification.

Consumption may be conducted upon co
principles, or the reverse. It is clearly the i
every individual that he should not consume h
by expenditure upon objects which are to yie
pleasure or profit of any kind; that every thing
chases should be consumed as thoroughly as
and not in any respect wasted. In this way n
is lost. It is the same with national consum
expenditure. When the public money is spe
war, upon idle functionaries or sinecurists, or
kind of public work which is not to be either
or indirectly useful, the labour which produ
money is lost, or has gone in vain. It is no
such cases to say that money has been circula
employment has been given, and so forth.
not absolutely need to be kept working in any p
way, and every idle consumer of others' goods
own is a source of loss to the community. Th
could have been applied otherwise, and to a u
stead of a useless end.*

LIFE-ASSURANCE.

for labourers is moderate; the command of the
r over the means of subsistence is consequently
iminished; and the population is observed to
with a moderate pace, varying in each country,
y as may be, according to the variations in the
r its support. Where these funds are station-
ve are taught to believe is the case in China, and
ertainly been the case in Spain, Italy, and pro-
ost of the countries of Europe during certain
of their history, there the demand for labour
tionary, the command of the labourer over the
f subsistence is comparatively very scanty, and
on is observed to make no perceptible progress,
retimes to be even diminished.
e second place, it is a fact equally notorious,
actual increase of the funds for the mainte-
f labour does not depend simply upon the phy-
acity of any particular country to produce food
r necessaries, but upon the degree of industry,
nes, and activity, with which these powers are
articular time called forth. We observe coun-
ossessing every requisite for producing the ne-
s and conveniences of life in abundance, sunk in
f ignorance and indolence, from the vices of their
nents, or the unfortunate constitution of their
and slumbering on for ages with scarcely any
in the means of subsistence, till some fortunate
troduces a better order of things; and then the
r of the nation being roused and allowed to exert
ith more freedom, more ample funds for the
ance of labour are immediately provided, and
on is observed to make a sudden start forwards,
e quite different from that at which it had be-
ceeded.
seems to have been the case with many of the
s of Europe during some periods of their his-
ut is more particularly remarkable in Russia,
olation of which, though very early inhabited,
extremely low before the beginning of the last
, and has proceeded with such rapid steps since,
larly since the reign of Catherine II.
also a fact that has often attracted observation
iew of the history of different nations, that the
f people occasioned by the great plagues, famines,
er devastations to which the human race has
casionally subject, has been repaired in a much
time than it would have been, if the population,
ese devastations, had only proceeded at the
te as before. From which it is apparent, that
e void thus occasioned, it must have increased
ster than usual; and the greater abundance of
ds for the maintenance of labour, which would
to the survivors under such circumstances, indi-
gain the usual conjunction of a rapid increase of
on with a rapid increase of the funds for its
ance. Just after the great pestilence in the
Edward III., a day's labour would purchase

difficult to obtain the means of subsistence for increasing numbers. He concluded that, at the utmost, the means of subsistence would be found, at the end of each successive quarter of a century, to have increased only at the rate of double for the first, triple for the second, quadruple for the third, and so on. Thus (said he) while population would go on increasing in a geometrical ratio, that is, as 1, 2, 4, 8, 16, 32, 64, 128, &c., food would increase only in an arithmetical ratio, that is, as 1, 2, 3, 4, 5, 6, 7, 8, &c.; and the consequence of an unchecked increase of the one, with the utmost possible increase of the other, would be that, when the population of the globe had advanced to 500,000 millions, there would only be food for 10,000 millions, or a fiftieth part of the number!

Considering, then, that there is a power and a tendency in human beings to increase so rapidly, and that, in point of fact, it is only in a few favoured spots that they do increase at such a rate, Mr Malthus concluded that there must be some counteracting agencies, or *checks*, in constant operation, in almost all communities, to restrain population at a lower rate of increase, or keep it stationary. In looking about to discover these checks, he satisfied himself that they were of two orders: first, there was the mortality produced by the effects of deficient food and of wicked passions; these he called *positive checks:* then there was the check produced by a prudent forethought in human beings, leading them to avoid marriage, on account of the little prospect of being able to rear a family in comfort; this he called the *preventive check.*

Arriving at this point, Mr Malthus and his followers proceeded to show how their doctrines were applicable for the benefit of communities. It was held that there could be no choice between the two kinds of checks: it was clearly preferable that population should be restrained by the preventive check.

"It is observed," says the *Edinburgh Review*, "in most countries, that in years of scarcity and dearness, the marriages are fewer than usual; and if, under all the great variations to which the increase of the means of subsistence is necessarily exposed from a variety of causes—from a plenty or scarcity of land, from a good or a bad government, from the general prevalence of intelligence and industry or of ignorance and indolence, and prudence, seem to be go

to increase the industry of a nation? Contemplated thus, the tendency to increase would appear as a means, in Providence, to stimulate men and nations to the utmost possible exertions for the improvement of the materials placed at their command, so that no faculty of their being might lie waste, and no power of physical nature remain useless. Supposing this to be one of the final causes of the population principle, the preventive check of the Malthusians must, of course, appear as an impious attempt to control one of the Creator's most important designs.

OBSERVATIONS.

Such is an outline of the arguments which have been used on this famous question. It must, we think, be generally evident to new and dispassionate inquirers, that there is some truth in the views of both parties, but that the full and exact truth has not been stated by either. For arriving at this the means do not perhaps exist in the present imperfect state of statistical science; but in the mean time we may present a few considerations which have occurred to ourselves on this subject.

It appears to us to be only an assumption that there is every where a tendency to double the population every twenty-five years. We certainly see that such is the case in North America; but possibly this is considerably owing to temptations which are presented by the state of the country, labour being so expensive in all such regions, that a bounty may be said to be put upon the possession of a family. Perhaps the natural tendency is there drawn into something approaching to an unnatural state of activity.

Allowing that the increase is no more than what the natural inclinations of that people dictate, it is by no means clear that all nations possess natural inclinations in the same degree. We know that many features of human character are manifested in very different degrees in different nations; and it is therefore not unreasonable to suppose that there are also national differences in those feelings which lead to the increase of the human family. Individuals, it is well known, are characterised very differently in this respect. There are also obvious differences in families, the peculiarity being apparently hereditary. Why, then, may there not be differences also in nations? Perhaps the light to be

POOR-LAWS.

stages of society there has existed a class, em-
ly termed *the Poor*, composed of persons who,
the charity of their neighbours, would be nearly
ly destitute, being themselves unable, or all but
, to supply their own wants. It is easy to see how
as been and must be; for, from accidents in the
ion of the natural laws presiding over the birth of
als, some come into the world without the usual
f body and mind required for obtaining a suffi-
subsistence; the accidents of life deprive others
e use of their full powers; many reach an infirm
, without having laid up a store to help them
; the consequences of vice and error—of all those
se temptations which beset human nature, and
which no one is altogether safe—leave many in a
s state; finally, in the imperfection of all politi-
stitutions, there are circumstances which press
ly upon classes and persons, tending to make
wn efforts for their subsistence insufficient. The
ion of accidents upon one class of parents, and
es and neglect of others, likewise leave many
and helpless children in a state in which they
be destitute but for the aid of neighbours. All
e causes being inherent in human nature and
iety, we may be assured that "the poor we shall
with us always," however it may be possible, by
ous and humane efforts, to keep their numbers
comparatively moderate bounds.
an early state of society, the relief of the poor is
to the operation of benevolence amongst indivi-
; and the destitute are either succoured by those
y near them, or go forth to beg relief in a wider
. Generally, the efficacy of benevolence for this end is made the greater, in consequence of the succour of the poor being set forth as a duty in almost all religions. In addition to occasional and particular acts of charity, donations are made and legacies left, for the purpose of affording a more or less regular and systematic relief within certain bounds. As society, however, advances, it is found that the charity of individuals is either an insufficient means of succouring the poor, or is attended with certain inconveniences. The classes of society becoming more detached from each other, cases of destitution make appeal, almost exclusively, to the parties nearest in poverty; while the rich, and the comparatively rich, are saved from all concern in the matter, merely because local and social circumstances spare them a personal connexion with it. A relief by benevolence is found to be oppressive to those who have kind feelings, while the niggardly and ungenerous escape. A dense and highly artificial state of society rendering it impossible to keep watch over particular cases of destitution, the relief afforded is unavoidably partial and unequal—no one knowing the real needs of a petitioner, or how far he is relieved by others; so that a door is opened for the practice of gross imposture, while the more modest poor are probably the least liberally treated. It is also generally found, that this state of society is attended with an increase of the numbers of the poor, rendering individual efforts insufficient, and tending to such disorders, that a public provision becomes necessary as a matter of police. A new principle is then evolved from the natural fact of the existence of a poor class, namely, that the community cannot be safe from imposture, spoliation, the propagation of disease, and other evils, unless it combine to assure itself that no person in the country shall want the necessaries of life.

It is then that states begin to make arrangements for the regular relief of the poor; and, generally, these arrangements are of a more or less advanced and efficient nature, in proportion to the advanced social condition of the respective countries. In the most of the Catholic states of Europe, the system adopted consists simply in the ministers of religion taking charge of the voluntary contributions of the people, and administering them to the best of their ability. In Portugal, Sardinia, Venice, France, Belgium, Holland, and some other countries, the same system exists, excepting only that the ministers of religion are superseded in their charge by officers appointed by the state. We need scarcely remark, that the single fact of the funds being voluntary renders it impossible, as to any of these countries, to be certain that the provision for the poor is sufficient in amount. In England, Ireland, Prussia, Bavaria, Wurtemberg, Mecklenberg, Berne, Russia, Denmark, Sweden, and Norway, the principle is recognised that a compulsory provision ought to be made to ensure that all the members of the community shall have the means of subsistence. In England, this has been in operation for nearly three centuries; but, in the most of the other countries enumerated, it is of comparatively recent adoption. In America, all the states of the Union which are of English origin have, from their commencement as colonies, adopted this principle. In Scotland, laws for a compulsory provision have existed nearly as long as in England, but have never been carried out into full operation. In that country, a voluntary system is followed in more than one-half of the parishes, and a compulsory system in the rest, the clergy being, in almost all instances, the administrators; but nowhere is the principle of a legal right in the poor to relief, or, what is identical therewith, of its being the interest of the community that relief be granted, practically recognised.

ARRANGEMENTS FOR THE POOR IN ENGLAND.

Acts respecting the poor in England only made arrangements as to the places in which they should beg, until, in 1536, immediately after the dissolution of the religious houses, by which the poor had previously been in a great measure supported, it was found neces-

this law were, "to set the poor to work, to relieve the lame, impotent, old, and blind, and to put out their children as apprentices." To attain these objects, the inhabitants of every parish in the country were required to raise a fund sufficient to maintain their own poor; and the administration of this fund was placed in the hands of parish overseers, under the control of justices of the peace. The leading merit of this act was, its requiring that the claims of the able-bodied for relief should be subjected to a *test*, to prove that the alleged want was not the result of an indolent disposition: *such persons were to receive relief only on condition that they should work for it.* To make this rule certain of operation, an act passed eight years after (7 Jac. I. c. 4) ordered the building of *houses of correction*, to be provided with cards, mills, and other implements, and where the vagrant able-bodied poor should be set to work. This may be considered as the origin of the workhouse system in England.

It is clear from the statutes of this period, that the chief evil which the legislature found itself called upon to consider and provide for, was the indolent and vagrant disposition of a large section of the people. It was not, as now, that many men occasionally find a difficulty in getting work, but that many were unwilling to work, preferring to wander about the country in idleness. It appears that these vagrants were accustomed to stay only for a short period in one place, and to flit about to wherever they thought they would be best supported; nor can it be doubted that, in lonely places, they would not be backward to use means for terrifying the lieges into contributions for their benefit. That, in such circumstances, these people would want all moral culture, and be a source of danger to the community, is of course evident. It required many years' operation of the law to reduce this evil; but at length, about the end of the seventeenth century, it seems to have been considerably lessened. The same class of persons then began to prefer the benefits to be obtained through the claim which the law gave them upon their native parishes, and the evil of vagrancy was gradually exchanged for one of another but less grievous kind—an inclination to a timid and slothful dependence on the relief to be obtained at one fixed place.

The houses of correction were mainly penal establishments; and it was not till 1723, that workhouses

overseers, and others concern
the poor, to regulate their allo

ar part of its domestic polity, a wonder to neighing nations. The sum raised for poor-rates 776, while the workhouse system of 1723 was operation, was only £1,720,316; in the three after the passing of Gilbert's Act (1783-4-5) it ged £2,167,749. But the average of 1801-2-3 5,348,205; in 1818, a year of scarcity, it reached normous sum of £9,320,440; and even in the fair of 1830, 31, 32, and 33, it was above eight m. This was an increase far exceeding that of pulation, and the more alarming as it took place a period of progressive national prosperity. Alevery where it pressed very severely upon the rty of the country, and in some places had even property to be abandoned, the rates exceeding t could be derived from the land.

evil being generally felt and acknowledged, a royal mission was issued in 1832 for inquiring into it, in that parliament might apply a remedy. The ing is a condensed summary of the report which body drew up, after a careful investigation cond throughout every part of England and Wales: hat wherever the expenditure had most increased, also, the industry of the labourer had proporly degenerated, because in such places subsistence he poor-rates was more easily obtained than by . That under such influences his prudence and were discarded, because they could, with the utcertainty, only secure for him, by present sacrifice oyment, the same future advantages of which the held out a prospect without the necessity of any ce save that of independence. That his sobriety temperance were thus left without encouragement, the other hand, exposed to the temptations of rative idleness, and the facilities for the indul- in idleness and intemperance which always acany the growth of pauperism: his respectability meanour was now useless, as respectability of ter ceased to be relied on as a means of securing oyment, itself no longer an object of desire. That same proportion as he became independent of r industry, did he also become independent or lless of the comforts of his home, which are inuable to the labourer after a day of toil, but are sought or valued as a change after a day spent ness or dissipation. It was also observed that, e habit of pauperism increased, the standard of stence of the labourers in the district was lowered, lief never being sufficient of itself to maintain per independent of all work; and yet, by renng him partially so, constantly tempting him to that further portion of comfort which was atble only on the comparatively hard terms of earnt by the sweat of his brow. The standard of the ers' subsistence being once lowered, that of the strious labourers amongst whom they lived, and occasionally felt the effects of their competition, also. Where the system prevailed of allowing re- aid of wages, there the operation was immediate, ll the labourers were at once pauperised, being lly exposed to the effects of a system which left all stry, beyond a certain point, without its reward, therefore without a visible object. While these nces were destroying the industry and morality he able-bodied labourers, the bastardy-law was ing out encouragement to female unchastity, in the of a money allowance for each bastard, which, by mount, of itself elevated her condition in proporto the number of her spurious offspring, rendering ther of several bastards better off than she would been as a mother of as many lawful children, and ring her a dower which usually tempted some man arry her; while the same law, by subjecting the ised father to punishment, often subjected him, at woman's discretion, to the alternative of marriage jail—the former of which was generally chosen as least present evil. Under these influences female tity had, in many districts, so far ceased to be ed as a virtue, that not only the woman herself, but her parents and her husband, seemed, where the law had had its full effect, to have become indifferent to it.

The evils of the system were not confined to the paupers, but extended to all who had to administer the law. So large a fund as between seven and eight millions, administered without any practical responsibility, naturally tempted the cupidity of the officers through whose hands it passed. The office of overseer was, therefore, generally sought by a class of small farmers and tradesmen, to whom the office must have been most burdensome had it been discharged gratuitously as the law provided. It was found that the overseers were usually appointed, in places where the evil had reached a great height, not from the class of the *substantial householders* of the parish, as the statute of Elizabeth requires, but were usually needy persons, to whom the indirect advantages of the office were important, and who were helped into the office by the efforts of persons similarly interested, either as tradesmen of the parish, or as owners of the dwellings which the paupers inhabited, or in other ways, more as receivers, directly or indirectly, of the rates, than as rate-payers. The spirit of the enactment in the 45 Geo. III. c. 54, § 1, which provides that no contract for the lodging, keeping, or maintaining the poor, or for taking the benefit of their work for their better maintenance, shall be valid, unless the person with whom it is made shall be resident within the parish, was fully carried out in practice in nearly the whole of the 15,000 parishes and places separately maintaining their own poor—every tradesman of the parish, and every employer of labourers, being bribed to maintain whatever system the vestry adopted, by a share in the profitable supply of the parish poor, or by the payment of a part of the wages of his labourers in the shape of relief to them out of the rates. The refractory parishioners were constrained to acquiesce, on pain of losing these and similar advantages, which, being withdrawn or denied, left to them only the obligation of paying those rates. To secure the full operation of this system, the parish was not permitted to deal elsewhere for any commodity with which any parishioner could supply it, and was thus usually confined to the worst market for the goods it purchased, in the same manner as, by the settlement laws, it had been cut off from the supply of other labourers while any belonging to the parish remained unemployed.

The evidence seems also to prove that the functions of the magistracy had almost invariably ceased to be applied to the objects for which they had been created. The magistrates of counties were usually too dispersed, and too little immersed in the actual business of the several parishes, to avail themselves of the advantages which the overseers and the other more immediate administrators of the system derived from it. The magistrates of corporate boroughs, towns, and cities, were, however, in many instances, found to be not less rapacious or ready to apply the administration of the law to their pecuniary profit or direct advantage than the parochial officers. But although the magistracy must generally be acquitted of having sought to derive an immediate pecuniary advantage from the administration of the poor-laws, they were none the less ready to pervert the law to purposes utterly at variance with its original purposes and with the prosperity of the community. Very many of the magistrates, influenced by benevolent intentions, were ready on all occasions to admit the claim of the pauper, and to compel overseers to administer relief when they inclined to refuse it: such magistrates were constantly resorted to by paupers in preference to others who more vigilantly examined the grounds of their claims; and a reputation for being the *poor man's friend* was easily earned by the lavish and immoderate expenditure of the fund of the general rate-payers. This reputation was found to be useful in many ways, and was thus sought for political purposes, or for the attainment of local power, or for the mere gratification of vanity, by many magistrates,

an act was passed (4 and 5 Will. IV.), usually called the *Poor-Law Amendment Act*, by which these monstrous evils were for the most part extinguished, and a return made to the just principles and practices dictated by the acts of 1601 and 1723. Both parties in the state supported this measure in almost all of its provisions,† and it was only opposed by a few individuals. With regard to the impotent poor, this act rather increased than diminished the liberality of the arrangements, while it made several other considerable improvements. The great class of adult persons who, from old age or infirmity of body, are wholly unable to work, were to remain, as before, entitled to a support by means of out-door allowances. Of destitute children, those unlikely from natural defects to be able to win their own bread, were provided for by out-door relief: those, on the other hand, who were likely to prove useful members of society, were taken in charge and reared in separate establishments, where their education and training for industrious callings were particularly cared for. Judicious provisions were also made for their being ultimately set afloat in the world, as apprentices. With regard to illegitimate children, several former provisions of evil tendency were annulled, and it was provided that no regard should be paid to them till they became actually chargeable upon the parish, when relief should be extended through the mother, she being in this respect treated as a widow. Persons unable to support themselves through accident or from sudden and dangerous illness, were to receive temporary relief, and to have all necessary medical attendance. Insane paupers were to be placed in proper asylums at the expense of the public.

The provisions for *able-bodied* claimants formed the most important part of this act, as indeed it was in this department that the abuses of the old system were the most glaring. The main feature of the new arrangements was the erection of workhouses by unions of parishes, where relief should be offered to able-bodied

RRANGEMENTS RESPECTING THE POOR IN SCOTLAND.

e poor are provided for in a much more sparing
er in Scotland than in England; and the able-
d, so far from having even the offer of mainte-
e in a workhouse, are totally overlooked.
e early acts of the Scottish parliament respecting
or, contain, like those of the English parliament,
provisions for the repression of begging. At length,
79, an act, apparently suggested by one of the
sh parliament seven years earlier, introduced the
iple of a compulsory assessment for the impotent
providing at the same time that able-bodied
rs should be punished as vagrants. The adminis-
on of this law was committed to justices of peace,
class of functionaries did not then exist, but were
mplated, though no such appointments in reality
place at that period. Acts of 1592 and 1663 ulti-
y committed the management of the poor, in coun-
rishes, to the heritors (proprietors) jointly with
irk-sessions—the latter being parochial ecclesias-
courts, composed of the minister and a small body
y elders—and to the magistrates in royal burghs.
these administrators there is no appeal except to
upreme civil court of the country (Court of Ses-

sion), an arrangement of course equivalent to there being no appeal at all. Three years' residence confer a *settlement*.

In 236 parishes, containing 1,137,646 persons (nearly the half of the population of the country), a legal assessment has been resorted to. In 126 parishes, with a population of 305,654, there is what is called a "voluntary assessment," which may be considered as only a regulated and equitable mode of voluntary contribution. In the remaining 517 parishes, containing a population of 872,626, there is no assessment whatever, and the funds for the poor arise from voluntary contribution, chiefly in the form of offerings at the church doors. The average annual sums collected under this system during the years 1835, 6, and 7, were—by collections at the church doors, £38,300, 10s. 2d.; by other voluntary contributions, £18,976, 10s. 2d.; from sessional fees, &c., £20,604, 12s. 10d.; from assessment, £77,239, 19s. The aggregate is £155,121, 12s. 2d. It is remarkable that the whole sum here described as raised by assessment, being for 236 parishes, including Edinburgh, Glasgow, and all the other considerable towns in Scotland, was just about a seventh more than the sum raised for the poor in *one London parish* in 1833 (St George's, Hanover Square).* In Scotland, the expenditure for the poor is equal, on the average of the above three years, to 1s. 3¾d. a-head on the population; in England, during the same period, the expenditure was equal to 6s. 10½d. a-head on the population.

As might be expected, the provision for individual paupers, is, in Scotland, extremely slender, and almost every where a vast number of claimants are altogether rejected. In the two workhouses of Edinburgh, for example, the average annual expense for each inmate is from £6 to £8. Excepting in these instances, the provision for the poor in Scotland may be said to consist in a small weekly dole of money, considered as a loan or aid, for which the relations of the parties, or the parties themselves, might afterwards be held chargeable, supposing that their circumstances allowed of its being refunded. In the case of persons who, from infirmity, fatuity, or infancy, can do nothing for themselves, and who at the same time have no relations able to aid them, the dole is considered as a full provision for maintenance: from 2s. to 4s. are given in such cases. Where any remains of health and strength exist, the allowance is usually less in proportion, and may be said to range from 6d. to 2s. a-week. It is in these cases considered strictly as an aid, in addition to what the individual can gain by personal exertions. In the unassessed parishes, the average allowance was, a few years ago, £1, 0s. 4½d. per annum. The administrators of the funds (usually the kirk-session) subject every application for relief to a rigid scrutiny, and never continue any relief when they think it ceases to be strictly necessary. Generally, it may be said, the provision is more liberal in towns than in the country, and in the Lowlands than in the Highlands. In the last districts the funds for the poor are extremely small. "There is something," says a late writer, "approaching to the ludicrous in finding the minister of Alness, in Ross-shire, saying, in his statistical account, that people come to his parish for the benefit of its poor allowance: the fund is £58, 18s. 4d., divided among 110 paupers, the highest annual allowance being £1, and the lowest 6s. If we make allowance for a resident and humane landlord, and take a glance at the provisions in the neighbouring parishes, we shall find, however, that this choice is not made without reason. In the very useful report of the General Assembly in 1839, we find that Dingwall, the immediate neighbouring parish, gives an annual uniform allowance of 5s.; Foderty gives a maximum of 12s. and a minimum of 2s. 6d.; Cairnach a maximum of 12s. and a minimum of 4s.; Eddertoun a maximum of 8s. 6d. and a minimum of 5s. 6d.; Knockbain a maximum of 10s. and a minimum of 5s.; and Kirkmichael a maximum of 10s. and a minimum of 3s. 6d. These

* The sum raised for the poor in that parish in 1833 was £67,316. The new law reduced it in 1835 to £27,301.

'The parish of Kilmuir, in the Island of Skye (cutting off the district attached to the parliamentary church of Steinscholl), contains a population of 2275; the average amount of funds, distributable among the poor, is about £3 annually, and a distribution is made only once in two years. The last distribution, prior to the date of the return (21st August 1838), took place on the 3d March 1836, when the sum of £6, 3s. 6d. was divided among 68 paupers.' The minister states, 'As the amount of church collections has varied little for several years back, it has been found necessary to restrict the number of paupers to about 60 or 70 at each distribution; but, were the funds of greater amount, it would be necessary to admit no fewer than 200 paupers on the roll.'"—*Westminster Review*, xxxvi. 394.

The smallness of the provision for the poor in Scotland, is not to be rashly attributed to want of feeling on the part of the nation. There is in Scotland a strong prejudice against all but self-dependent modes of existence. It is a general opinion that all systematic succour held out to the poor, is productive of evil instead of good, even to the poor themselves. This succour is thought to be particularly detrimental, when it is the result of a fixed assessment or rate, for then it is supposed that the poor are led more particularly to depend on the public charity instead of their own exertions or the kindness of relatives. The smallness of the sums given to the helpless, can only be attributed to this general prejudice against pauper relief; for it may be presumed, that, if there were another feeling in the case, the ordinary slender funds would be augmented by a sufficient assessment. What proves very strikingly that opinion, and not want of benevolent feeling, is the main cause of the small provision, is, that the humbler classes in Scotland have, in general, as great a disinclination to ask public charity, as the wealthier classes to give it. They are generally anxious to avoid resorting to the kirk-session as long as possible, and only do so when all other resources fail. This, we say, is generally the case, for of late years there have been strong symptoms of a change of feeling on this subject amongst the Scottish people.

The conviction is ing that the present system is inequitable with t to districts, and nowhere so liberal as a true , not to speak of humanity, requires.

ARRANGEMENTS RESPECTING THE POOR IN IRELAND.

Ireland, there was till a recent period no syste- provision for the poor, but the country was by ame destitute of institutions designed for their f.

gislative enactments had progressively, during the ntury, established county infirmaries, dispensaries, ic asylums, houses of industry, and receptacles for ate infants and old people; and similar institutions, er with schools, lying-in hospitals, houses of re- and mendicity houses, had been set on foot in ous places by private benevolence. But, while e was thus done for the alleviation of temporary and al distress, there was a mass of mendicancy, and ount of general suffering from occasional famine consequent epidemics, which made Ireland singular among the countries of Europe. It was calculated that, out of a population of between seven and eight millions, upwards of two millions were in a state not much short of permanent mendicancy. The great bulk of the people being an agricultural peasantry, living on small patches of land, and depending mainly on the potato crop, a failure of that product was attended with wide-spread misery, invariably followed up by destructive fevers. The epidemic of 1817, which was the effect of the failure of the crop of 1816, affected a million and a half of persons, and carried off 65,000. The people, moreover, having no resource when they lost possession of their little pieces of ground, landlords found that they were rapidly losing all power over their property. Desperation made the tenants cling to their ground with a pertinacity which nothing could overcome. A common danger having united them in one common cause, the forcible extrusion of a tenant was resisted by one and all, or, if effected, it was sure to be savagely avenged. Practically, the tenant was able to remain on the ground as long as he chose, without much regard to the payment of rent, unless his *good-will* was purchased either by the new tenant or by the landlord. The inconveniences experienced in consequence of the bulk of the people being thus always on the verge of destitution, and without any resource when they reached that point, had become, in addition to those of actual mendicancy, so grievous, that a poor-law began to be contemplated as necessary for Ireland; and in 1833 a royal commission was issued for an inquiry into the subject.

In consequence of the report of this body, an act was passed (1 and 2 Victoria, c. 56), for the introduction of a modified poor-law into Ireland. In the principal arrangements, those adopted in England under the Poor-Law Amendment Act were followed; and the general superintendence was confided to the same commissioners. The system is still in its infancy; but it has so far worked well. In March 1841, 127 unions had been formed and declared, and 60 workhouses were in progress, or in operation. It is anticipated that three more unions will be all that are necessary.

GENERAL OBSERVATIONS.

Poor-laws are, after all, only an expedient for meeting an evil partly inherent in human nature, and partly the consequence of its erroneous moral and political condition. Were all born equally sound, and were all so instructed and so placed socially that each man realised a reasonable sum for his labour, and was disposed to make a proper use of his gains, there would be no need for poor-laws. Such conditions not existing, this expedient is unavoidably called into use, and we must not be surprised that, as one designed to meet great evils, its own operation is attended by less ones. By far the worst effect of poor-laws is the moral degradation which they produce in those for whose benefit they are established. The man who has to ask for public relief to his necessities, loses from that moment the self-respect on which much of his virtue depends. A fatal lesson is taught him—that his wants may be supplied without his own exertions—and the motive to an independent and industrious course of life is greatly shaken, perhaps destroyed. This is itself an evil of such serious magnitude, that it forms with many an insuperable objection to all regular provision for paupers. Such may be said to have been, till a recent period, the public feeling of Scotland on this question, and it still is the predominating sentiment of a large portion of society in that country. It is an objection which we, for our own part, would have difficulty in overcoming, if we did not see around us the awful effects which an inadequate provision for the poor works, in the present condition of society. Unquestionably, nothing but a consideration of the horrible inhumanity, and the extreme dangers to the common weal, which are inseparable from the neglect or repulse of pauper claims, could excuse the deterioration which we unavoidably effect in a man's nature, by giving him that for which he has not laboured.

Another great evil of poor-laws is, that they take

away part of the fruits of industry from those who have legitimately acquired them, and bestow them upon the idle. Industry is by this means discouraged, and sloth and improvidence are in a proportionate degree fostered. In England, this had reached to an enormous height, and even now the abstraction of five millions from the gains of the industrious, must operate very seriously in retarding the progress of the country. It is, however, as already said, a tax unavoidable in present circumstances, if we would escape more serious evils.

While a reasonable doubt can scarcely be entertained as to the propriety of both succouring the helpless and offering a modified provision to the able-bodied in a needful state, it must be equally clear that the more that habits of foresight and self-dependence are propagated in the country—the more that all-sustaining moral influences are diffused through it—we may expect to see the less need for poor-laws. Although there are upwards of twenty millions in savings' banks, and benefit societies are widely spread, still the great bulk of the labouring classes of this country live from hand to mouth, without any store whatever on which to fall back in the event of sickness or an occasional lack of employment. This is a preposterous state of things. What is to be expected of a people, the great bulk of whom are contented to live with only a little accident between them and a state of dependence on private or public bounty? Sickness is what all are liable to at all times; failures of employment take place at frequent intervals every where. There surely might be some better provision against such contingencies than a public provision, which makes the recipient a degraded man for ever. Individuals might be induced, by an improvement of the moral agencies of the country, to do much for the securing of their own independence; and the remainder of the required provision might perhaps be obtained by systematic contributions from the labouring classes towards a common fund, from which succour could never be a degradation, seeing that they had themselves created it. Proposals of this kind are apt to strike the mind unfavourably, from their being new; but the position at which this country has arrived is in some degree new, and accordingly calls for measures of a different kind from what we are accustomed to contemplate. Certainly, while only the expedient of poor-laws is adopted, the community can never be inspired, in all its departments, with that manly and independent feeling which is the inseparable associate of all the other virtues, and the great distinction between the freeman and the slave.

LIFE-ASSURANCE.

Life-Assurance, in its ordinary character, is a means of securing, by a present payment in full, or of an annual payment, a sum to be realised after the decease of the party.

It is obvious that, to many persons, the having this in their power is of great importance. To none is it so important as to individuals in the middle walks of life, who, for the present, are perhaps able to maintain their families in comfort, but being unable to accumulate a large surplus capital, cannot be sure that, in the event of their death, those dependent on them will not be thrown into poverty. To such persons, life-assurance presents itself as a ready and convenient means of providing for those in whom they are interested. With a certain annual sum laid aside from a professional income, or from the profits of trade, such a person can make sure that, though death cut him off abruptly, his widow and children will have something to look to, either for an entire maintenance, or to aid in enabling them to gain one for themselves. By the same means, an individual, possessing an entailed estate, can make provision out of its current rents for those younger and more helpless children, who, at his death, would cease to be benefited by it. An individual, also, insures in behalf of another, or having a large claim in the form of debt, can insure upon the life of person such a sum as would be sure to cover in the event of that person's sudden death. There are many other circumstances in which life-assurance may become highly beneficial; but its chief utility is securing a certain sum to helpless persons, in the event of the decease of those on whom they depend.

The principle on which life-assurance must be conducted is one which it has been reserved for modern times to discover, namely, that, while the duration of the life of a single person is of all things the most uncertain, it is possible to ascertain, with tolerable clearness, the average of a *multitude* of persons of a particular age, how many will die within next year, how many in the second year, how many in the third, and so on. The medium on which calculation gives what is called the *expectation of life* for each person of the set. A certainty, in short, is attained in this proverbially uncertain subject, when we take a great number of persons, and consider them with regard to the circumstances in which they live. It is found, for instance, that, of 100,000 persons, of a certain age, residing in this country, the number who will die within another year has elapsed, will be about 1521, or rather more than one and a half per cent. Supposing that 100,000 persons were to associate for the purpose of making sure that the widows or other heirs of each person who died within a year should have £1000, it would only be necessary, in that case, for each person to contribute as much to a common fund as would amount to £1,521,000, or a thousand times 1521; that is, each would have to pay in £15, 4s. 2d. It is evident that those who died, or their heirs, would profit to the extent of £984, 15s. 10d.; but without injury to those who survived, for these also had their chance of gain, for which it was but fair that they should pay. This would be a simple transaction in life-assurance, and would serve to convey an elementary idea of what life-assurance is, though, in practice, the transactions are usually of a somewhat more complicated kind.

An assurance is rarely transacted for a single year. The object of most is to pay a certain sum every year as long as they live, in order that a sum may be realised at their death. Assurers are also of various ages. The young have the expectation of longer life than the old. It therefore becomes proper that they should pay more than those more advanced in life. Indeed, the payment is to be a payment appropriate to each particular year, and this, accordingly, is the case. Another circumstance claims particular consideration. The payments by assurers are not to clear off one year's claims, but to realise a sum many years hence, large funds become accumulated, and upon the improvement of these depends. If a high rate of interest is obtained, the funds experience a rapid increase, and the less money are required to effect insurances. If, on the other hand, the interest realised be small, the ensurers must make their original payments so much the larger.

Life-assurance is effected in this country by offices established by joint-stock companies, who look to making a profit by their business, or by societies assuring societies. The former are shortly called *proprietary*, and the latter *mutual* offices. Offices of the first kind are usually held by a joint-stock company with a large subscribed capital; and the chief advantage which they hold forth, is the ample security of all claims presented by the capital, and the responsibility of the shareholders. In the case of a mutual office, there is only, it may be said, an association of customers, each of whom is concerned in insuring his neighbour. In this case, however, all surplus profits, instead of going into the hands of a trading company, remain the property of the insurers, and are ultimately to be divided amongst them. For a long time, the business was conducted almost exclusively by offices of the first kind, but it was at length seen that all desirable security was to be obtained on the association principle, and for some years this system has been extensively

NCE.

louse of Commons, appointed to investigate this
ject, reported—"The evidence appears to your com-
ee to be strong and decisive in favour of the use of
e which give an expectation of life higher than the
hampton. In truth, there is not even a *prima*
ease in their favour."
e *Carlisle table* was formed, not from the register
trials among a floating population, but from observa-
ns of the deaths which occurred, at each year of
among a certain stated number of persons in the
of Carlisle. The observations were conducted by
leysham, and the calculations made, in the most
tific manner, by Mr Joshua Milne, author of a
able work on annuities.
nally, the *Government tables* were compiled from
rvations on the progressive mortality occurring
g the government annuitants and other selected
es, distinguishing the sexes. They were prepared,
r the directions of government, by Mr Finlaison,
ry to the National Debt; and in 1829 were adopted
arliament as the basis upon which their future
lations should proceed. Mr Finlaison's researches
lished the fact of the longer duration of female

n of human life" in the course of the time over
h his inquiries extended—so great "that the dura-
f existence now, as compared with what it was a
ry ago, is as 4 to 3 in round numbers."
sides these three, a table was framed by Mr Grif-
Davies from the deaths reported from time to time
g the members insured in the great Equitable So-
of London, from its commencement in 1762 down
29, which has since been recalculated and continued
to a later period by Mr Morgan, the actuary to
society. This table is very valuable, as confirming
ubstantial accuracy of other observations, with
h it very nearly corresponds. The relation which
tables bear to each other may be seen at a glance
the following table, showing the *mean expectation*
at various ages according to each.

By Northampton.	By Carlisle.	By Government.			By the experience of the London Equitable.
		Males.	Females.	Mean.	
33·43	41·46	38·39	43·92	41·19	41·87
30·85	37·84	35·00	40·61	38·35	39·12
28·27	34·34	33·17	37·37	35·37	34·23
25·68	31·00	30·17	34·31	32·24	30·93
23·08	27·61	27·02	31·12	29·07	27·40
20·32	24·46	23·75	27·81	25·78	23·87
17·99	21·11	20·30	24·35	22·33	20·56
15·58	17·59	17·15	20·79	18·97	16·29
13·21	14·34	14·39	17·32	15·96	13·91

dependently of the acknowledged deficiency of the
on which the first-mentioned table is founded, the
fact of its differing so much from any other au-
ic observation, is of itself conclusive against it;
by parity of reasoning, the close agreement of the
s affords strong presumptive evidence in their
r, and imparts a high degree of certainty to cal-
ions based upon them. The Carlisle table occu-
a mean place between the male and female obser-
ns of government, showing a somewhat shorter
ion than the mean of these. It also coincides
nearly with the experience of the Equitable So-
Considering that it is thus supported by two
sets of observations, and that the whole three ex-
over a period during which life was not so good
has since become, the general opinion in favour
e safety of the Carlisle tables for life-assurance
be held as well founded. This opinion receives
boration from the experience of the Scottish
ws' Fund, which extends over the last twenty-
ears. In 1834, the auditor of that society reported,
result of a careful investigation, "that the re-
d number of deaths by the Northampton tables,
h is the table of the society, is to the actual mor-
during the whole progress of the society, as 100 to

away part of the fruits of industry from those who have legitimately acquired them, and bestow them upon the idle. Industry is by this means discouraged, and sloth and improvidence are in a proportionate degree fostered. In England, this had reached to an enormous height, and even now the abstraction of five millions from the gains of the industrious, must operate very seriously in retarding the progress of the country. It is, however, as already said, a tax unavoidable in present circumstances, if we would escape more serious evils.

While a reasonable doubt can scarcely be entertained as to the propriety of both succouring the helpless and offering a modified provision to the able-bodied in a needful state, it must be equally clear that the more that habits of foresight and self-dependence are propagated in the country—the more that all-sustaining moral influences are diffused through it—we may expect to see the less need for poor-laws. Although there are upwards of twenty millions in savings' banks, and benefit societies are widely spread, still the great bulk of the labouring classes of this country live from hand to mouth, without any store whatever on which to fall back in the event of sickness or an occasional lack of employment. This is a preposterous state of things. What is to be expected of a people, the great bulk of whom are contented to live with only a little accident between them and a state of dependence on private or public bounty! Sickness is what all are liable to at all times; failures of employment take place at frequent intervals every where. There surely might be some better provision against such contingencies than a public provision, which makes the recipient a degraded man for ever. Individuals might be induced, by an improvement of the moral agencies of the country, to do much for the securing of their own independence; and the remainder of the required provision might perhaps be obtained by systematic contributions from the labouring classes towards a common fund, from which succour could never be a degradation, seeing that they had themselves created it. Proposals of this kind are apt to strike the mind unfavourably, from their being new; but the position at which this country has arrived is in some degree new, and accordingly calls for measures of a different kind from what we are accustomed to contemplate. Certainly, while only the expedient of poor-laws is adopted, the community can never be inspired, in all its departments, with that manly and independent feeling which is the inseparable associate of all the other virtues, and the great distinction between the freeman and the slave.

LIFE-ASSURANCE.

Life-Assurance, in its ordinary character, is a means of securing, by a present payment in full, or of an annual payment, a sum to be realised after the decease of the party.

It is obvious that, to many persons, the having this in their power is of great importance. To none is it so important as to individuals in the middle walks of life, who, for the present, are perhaps able to maintain their families in comfort, but being unable to accumulate a large surplus capital, cannot be sure that, in the event of their death, those dependent on them will not be thrown into poverty. To such persons, life-assurance presents itself as a ready and convenient means of providing for those in whom they are interested. With a certain annual sum laid aside from a professional income, or from the profits of trade, such a person can make sure that, though death cut him off abruptly, his widow and children will have something to look to, either for an entire maintenance, or to aid in enabling them to gain one for themselves. By the same means, an individual, possessing an entailed estate, can make provision out of its current rents for those younger and female children, who, at his death, would cease to be benefited by it. An individual, also, insure in behalf of another, or having a large claim in the form of debt, can insure upon the li person such a sum as would be sure to cov in the event of that person's sudden death. many other circumstances in which life-assu become highly beneficial; but its chief utili securing a certain sum to helpless persons, in of the decease of those on whom they depend.

The principle on which life-assurance ma is one which it has been reserved for moder discover, namely, that, while the duration of a single person is of all things the most uncer possible to ascertain, with tolerable clearness, of a *multitude* of persons of a particular ag within next year, how many in the second many in the third, and so on. The medium gives what is called the *expectation of life* for son of the set. A certainty, in short, is at this proverbially uncertain subject, when great number of persons, and consider them gard to the circumstances in which they li found, for instance, that, of 100,000 persons, residing in this country, the number who will another year has elapsed, will be about 1521, more than one and a half per cent. Supposing 100,000 persons were to associate for the p making sure that the widows or other heirs of who died within a year should have £1000. only be necessary, in that case, for each perso tribute as much to a common fund as would £1,521,000, or a thousand times 1521; that each would have to pay in £15, 4s. 2d. It that those who died, or their heirs, would re extent of £984, 15s. 10d.; but without injury to survived, for these also had their chance of ga which it was but fair that they should pay. T be a simple transaction in life-assurance, and to convey an elementary idea of what life-assu though, in practice, the transactions are ma somewhat more complicated kind.

An assurance is rarely transacted for a sing The object of most is to pay a certain sum ea as long as they live, in order that a sum may be at their death. Assurers are also of various a young have the expectation of longer life than It therefore becomes proper that they should than those more advanced in life. Indeed, the to be a payment appropriate to each partic and this, accordingly, is the case. Another p for particular consideration. The payments beg not to clear off one year's claims, but to mak a sum many years hence, large funds become a lated, and upon the improvement of these m pends. If a high rate of interest is obtained, th experience a rapid increase, and the less pa are required to effect insurances. If, on the o the interest realised be small, the ensurers re make their original payments so much the high

Life-assurance is effected in this country o offices established by joint-stock companies, w to making a profit by their business, or by m assuring societies. The former are shortly call *prietary*, and the latter *mutual* offices. Offices first kind are usually held by a joint-stock comp with a large subscribed capital; and the chief tage which they hold forth, is the ample secu all claims presented by the capital, and the re bility of the shareholders. In the case of a office, there is only, it may be said, an associ customers, each of whom is concerned in insu neighbour. In this case, however, all surplus stead of going into the hands of a trading co remain the property of the insurers, and are l be divided amongst them. For a long time, b ness was conducted almost exclusively by com but it was at length seen that all desirable secu to be obtained on the association principle; some years this system has been advancing ra

r than the other. In various instances, com- have scales of charges allowing of a participa- surplusages; and these are usually called *mixed* etary and mutual offices.

existing British offices are about eighty in num- ost of them of recent origin. The oldest is the ble, of London, established on the mutual prin- in 1706. At the time when it was set up, no tions as to life existed; and the conductors were ingly obliged for many years to proceed in a neasure at random, charging the same premiums ual payments for all ages under forty-five! The offices, dating from the last century, are the fol- ;—The Sun, 1710, proprietary; the Union, 1714, ; the London, 1721, mixed; the Royal Ex- , 1722, proprietary; the Equitable, 1762, mu- he Westminster, 1792, proprietary; the Pelican, proprietary; and the Palladium, 1797, mixed. are established during the first ten years of the t century:—The Globe, 1803, proprietary; the , 1805, proprietary; the London Life-Associa- 1806, mutual; the Provident, 1806, mixed; the 1806, mixed; the West of England, 1807, mixed; pe, 1807, mixed; the Eagle, 1807, mixed; the At- 08, mixed; and the Norwich Union, 1808, mutual. ates charged by these offices are very various, all cases they have been found sufficient for the In most instances, the companies divide large , while the mutual offices have realised equally surplusages, which they have divided amongst surers, in proportions according to the sum as- and the duration of the insurance, or upon other principle which may be thought prefe-

-assurance grew up in the last and present cen- amidst such an imperfect knowledge of the data ich it depends, that there is little to be wondered he great variety of rates charged by the different . These data are now much better understood, has become possible to arrive at a comparatively stimate of what charges are really required from ividual, in order to make good a sum at his death benefit of his survivors. There might be greater ss still, if the laws of mortality, now so well ascer- were alone concerned; but the rate of interest oney also enters into the calculation, and this, ell known, is liable to fluctuation. Loose as the thus remains in some measure, enough is ascer- to admit of an approximation being made to ing like a standard for the conducting of this ant branch of business.

rate of mortality and the rate of interest upon , are the two principal data on which life-assur- ractically depends. We shall first consider

THE RATE OF MORTALITY.

es of mortality are founded on the assumption man life is of a certain average endurance; and ns of them we estimate the number of deaths ay be expected among a given number of indi- , from the proportion that has been observed to among another class similarly circumstanced.

tables of mortality adopted in this country as sis of calculation for insurance companies, are n number. That known by the name of the mpton *table*, is the oldest now in use. It is d upon observations made by the celebrated Dr of the deaths registered for the population of the parishes of the town of Northampton, during rs between 1735 and 1780. This table, it is now vledged, shows far too high (or rapid) a rate of ity, owing partly to no effect having been given fluctuations in the population of that parish, from ration and other such causes, and partly to the improvement which has taken place in the value since the middle of last century, consequent upon roduction of vaccination and other improvements ical science, as well as in the habits and modes g of the people. In 1827, a select committee of the House of Commons, appointed to investigate this subject, reported—"The evidence appears to your committee to be strong and decisive in favour of the use of tables which give an expectation of life higher than the Northampton. In truth, there is not even a *prima facie* case in their favour."

The *Carlisle table* was formed, not from the register of burials among a floating population, but from observations of the deaths which occurred, at each year of life, among a certain stated number of persons in the town of Carlisle. The observations were conducted by Dr Heysham, and the calculations made, in the most scientific manner, by Mr Joshua Milne, author of a valuable work on annuities.

Finally, the *Government tables* were compiled from observations on the progressive mortality occurring among the government annuitants and other selected classes, distinguishing the sexes. They were prepared, under the directions of government, by Mr Finlaison, actuary to the National Debt; and in 1829 were adopted by parliament as the basis upon which their future calculations should proceed. Mr Finlaison's researches established the fact of the longer duration of female life. He also observed "a very extraordinary prolongation of human life" in the course of the time over which his inquiries extended—so great "that the duration of existence now, as compared with what it was a century ago, is as 4 to 3 in round numbers."

Besides these three, a table was framed by Mr Griffith Davies from the deaths reported from time to time among the members insured in the great Equitable Society of London, from its commencement in 1762 down to 1829, which has since been recalculated and continued down to a later period by Mr Morgan, the actuary to that society. This table is very valuable, as confirming the substantial accuracy of other observations, with which it very nearly corresponds. The relation which these tables bear to each other may be seen at a glance from the following table, showing the *mean expectation of life* at various ages according to each.

At Age.	By Northampton.	By Carlisle.	By Government.			By the experience of the London Equitable.
			Males.	Females.	Mean.	
20	33·43	41·46	38·39	43·99	41·19	41·67
25	30·85	37·86	35·90	40·81	38·36	38·12
30	28·27	34·34	33·17	37·57	35·37	34·33
35	25·68	31·00	30·17	34·31	32·24	30·93
40	23·08	27·61	27·02	31·12	29·07	27·40
45	20·52	24·46	23·75	27·81	25·78	23·67
50	17·99	21·11	20·30	24·35	22·33	20·36
55	15·58	17·58	17·15	20·79	18·97	16·99
60	13·21	14·34	14·39	17·32	15·86	13·91

Independently of the acknowledged deficiency of the data on which the first-mentioned table is founded, the mere fact of its differing so much from any other authentic observation, is of itself conclusive against it; and, by parity of reasoning, the close agreement of the others affords strong presumptive evidence in their favour, and imparts a high degree of certainty to calculations based upon them. The Carlisle table occupies a mean place between the male and female observations of government, showing a somewhat shorter duration than the mean of these. It also coincides very nearly with the experience of the Equitable Society. Considering that it is thus supported by two other sets of observations, and that the whole three extend over a period during which life was not so good as it has since become, the general opinion in favour of the safety of the Carlisle tables for life-assurance may be held as well founded. This opinion receives corroboration from the experience of the Scottish Widows' Fund, which extends over the last twenty-five years. In 1834, the auditor of that society reported, as the result of a careful investigation, "that the expected number of deaths by the Northampton table, which is the table of the society, is to the actual number during the whole progress of the society, as 100 to

57; and the proportion of the expected number by the Equitable experience is to the actual number as 100 to 87." We have understood that the experience of the Scottish Widows' Fund since 1834 is even more favourable to life. If, then, we were to take the whole twenty-five years' experience of this society as a criterion, we should come to the conclusion that the Equitable experience, the Carlisle tables, and the Government mean, are considerably within the verge of safety, while the Northampton tables are so far from the standard of modern life as to be, particularly with regard to the younger class of lives, quite unfit for use.

We have now to advert to

THE RATE OF INTEREST,

meaning the rate at which the yearly premiums may be expected to be improved.

This subject is one which does not admit of the same certainty as the other, and on which, accordingly, there may be great differences of opinion. In 1829, Mr Finlaison writes—"I take it for granted that it will be considered safe enough to assume that money, in a long course of years, will so accumulate, through all fluctuations, as to equal a constant rate of 4 per cent.; because, in point of fact, money has hitherto accumulated at 4½ per cent., whether we reckon from 1803 or from 1783." Other writers, again, and among them Mr De Morgan, looking chiefly to the high price of the 3 per cents. of late years, say that not more than 3½ per cent. should be counted on. Practically, the investments of assurance offices are made on terms much more favourable. It appears, from the published report of the Edinburgh Life-Assurance Company, dated December 1838, that for the three preceding years (1836, 1837, and 1838, when interest was unusually low), the average rate realised on their funds was £4, 16s. 6d. per cent.—about 1½ per cent. higher than the return from the 3 per cents. during the same time. And this, it is stated, was obtained without any part being laid out in the purchase of reversions—on which, it is known, a much higher rate can be got. The example of this office is quoted merely from the circumstance of their report happening to state the precise return at that period. Other Scottish offices are said to have obtained a higher rate. Most of them state that their funds are invested "about," "at," or "above," 5 per cent. Indeed, it is not conceivable that the offices could make such large returns to proprietors and members, in the shape of dividends and bonuses, if they did not generally improve money at about the rate last mentioned. From all of these circumstances, it does not appear likely that calculations for life-assurance, in which the interest of money is assumed at *four per cent.*, will, while Britain remains in nearly its present condition, prove unsound.

EXAMPLE OF LIFE-ASSURANCE CALCULATION.

According to the Northampton tables, out of every 11,650 persons born alive, there will be 46 living at the age of 90. From these tables being ascertained to be unfavourable to life, this must be understood as not strictly the case, but it may be adopted for the sake of illustration. The same tables make it appear that, of the 46, 12 will die in the course of the first year, 10 during the second, 8 during the third, 7 during the fourth, 5 during the fifth, 3 during the sixth, and the last remaining life will fail in the course of the seventh year. It is a favourite mode of exemplifying life-assurance calculation, to suppose these 46 persons, aged 90, associating for the purpose of assuring £100 to each at death. They are supposed to proceed upon the principle of paying all that is required in one sum at first, thus forming a fund which is to answer all the demands which are to be made upon it. In this calculation the improvement of money has been assumed at 3 per cent. The object is to ascertain what sum, by way of present payment, each is to contribute to the fund, so that it may discharge £1200 the first year, £1000 the second, £800 the third, and so on. In order to discharge

£.	£.	£. s. d.
1200, at the end of the first year, the society must be provided with	1200, discounted at 3 per cent., for one year, - -	1165 1 4
1000, at the end of 2d year,	1000, ditto, for 2 years,	942 12 9
800, at the end of 3d year,	800, ditto, for 3 years,	732 3 1
700, at the end of 4th year,	700, ditto, for 4 years,	621 19 2
500, at the end of 5th year,	500, ditto, for 5 years,	431 6 1
300, at the end of 6th year,	300, ditto, for 6 years,	251 3 3
And in order to discharge the remaining L.100 at the end of the seventh year, with L.100, discounted at 3 per cent., for seven years, - - - - - -		81 6 2
In all, - - - - - - - - -		L.4225 0 1

This, divided by 46, gives £91, 17s. 2d. as the sum (technically called *premium*) which each person would need to pay in at the foundation of the society. And this sum of £91, 17s. 2d. is the present value of a reversion of £100, at the age of 90, according to the Northampton tables, and taking interest at 3 per cent.

Supposing such a society to be constituted, and £4225, 10s. 9d. to be paid in by the 46 members, we shall see how its business would proceed until, at the close of seven years, death put a period to the account:—

The original contribution of L.4225, 10s. 9d. being put out to interest, at the end of the first year amounts to - - - - - - - - -	L.4322 5 1
From which deduct for the twelve lives which fall in the course of the year, - - - - -	1200 0 0
Fund remaining at the commencement of the second year, - - - - - - - - -	3122 5 1
Which, bearing one year's interest, will amount to	L.3216 16 7
From which deduct for the ten lives which fall in the course of the year, - - - - - -	1000 0 0
Fund remaining at the commencement of the third year, - - - - - - - - -	2216 16 7
Which, bearing one year's interest, will amount to	L.2283 4 1
From which deduct for claims, - - - -	800 0 0
Fund remaining at the commencement of the fourth year, - - - - - - - - -	1534 0 2
Which, bearing one year's interest, will amount to	L.1580 0 1
From which deduct for claims, - - - -	700 0 0
Fund remaining at the commencement of the fifth year, - - - - - - - - -	879 16 0
Which, bearing one year's interest, will amount to	L.906 10 1
From which deduct for claims, - - - -	500 0 0
Fund remaining at the commencement of the sixth year, - - - - - - - - -	406 10 0
Which, bearing one year's interest, will amount to	L.407 1 1
From which deduct for claims, - - - -	300 0 0
Fund remaining at the commencement of the seventh year, - - - - - - - - -	107 1 1
Which, bearing interest, will amount to -	L.110 0 0
Which will exactly discharge the last remaining claim, - - - - - - - - -	100 0 0

Practically, life-assurance is not effected upon lives so advanced as ninety years. It is common to confine business to ages under 60; and the great bulk of insurers are between 27 and 40, the time about which men in this country begin to feel the responsibilities of a family. But the calculations followed for the various ages are formed exactly in the above mode. All the persons of a particular age in a life assurance society are considered as a distinct group insuring each other. Of those, for instance, at 30 years of age, it is calculated what proportion will die the first year, what the second, and so on; and from each the society looks for such a contribution, present or prospective, as may make up an aggregate sufficient, with the accumulations from compound interest, to pay the sum assured upon each life in that group. It is quite the same thing to the society, or, we shall say, to the general interest, whether the individual insurers pay the whole required contribution at once, or in a series of annual payments, which, as the plan convenient for most, is that generally adopted.

FORMATION OF RATES.

According to the principles of which we have given a slight outline, offices form scales of rates at which

RS'S

THE PEOPLE.

BERS, EDITORS OF CHAMBERS'
IONAL COURSE, &c.

SERIES. PRICE 1½d.

AN RELIGIONS.

rse is believed to be animated and furnished with
al powers: water, land, animals, stones, trees,
egetables of every description, are all full of di-
purits and secret influences. He who makes any
e article his fetish, touches nothing of that sort
ver, whilst he consumes, without the slightest
tion, what others consider holy. There is a depth
ystery in this superstition which cannot be very
y understood. As far as can be reasonably con-
ed, this species of fetishism implies a connexion
en the visible and invisible, and that every thing
y certain means be made to have a relation to
and his destiny. The quality of the thing arbi-
set apart and invested with an attribute of di-
, is of no consequence; it may be a piece of bone,
gg-shell, or clay, indeed no matter what; there
merely be a belief of a relation subsisting be-
it and man, which relation often commences
er the first time when the thing is consecrated;
ward, every thing properly consecrated and re-
as the residence or tangible investiture of deity,
pposed to have a divine power, which, when
d, is able to incline the Deity to comply with the
s of men. Under different names, this superstiti-
reverence for visible objects has prevailed in all
and countries. At Cape Coast there is a rock pro-
g into the sea, invested with the character of a
, and worshipped by the priests, who annually
sacrifices to it, with ridiculous gestures and strange
ations. In the great temple of Mahometanism
cca, there is a stone which is the object of un-
ted respect and adoration. The Lacedæmonians
sacred stone, which, at the sound of a trumpet,
d to have raised itself to the surface of the water,
the bottom of the Eurotas. The ancient Ger-
and Gauls had also their holy rocks, caves, seas,
s, and trees, which afforded miraculous aid, and
ered oracles. In Ireland there was a stone in
a divine spirit was supposed to reside, and was
fore an object of religious worship. The Lap-
rs had a sacred mountain and a consulting drum.
ese superstitions are not a whit more respectable
the belief of the Negroes in fetishism; they are,
d, almost the same thing.
curling in the visionary ideas of some ancient
, a divinity was supposed to reside in matter, and
liable to be roused from its latent state into
ty, by means of consecration and the performa-
of solemn mysteries. In some of the islands of
ssific, if any person wishes to protect his pro-
, such as a house, field, or place of sepulture, from
ry or intrusion, he declares that it is *tabooed*, or
d under the guardianship of his gods; and the
that such is the case being universal, the pro-
is safe from aggression. Mr Ellis, in his "Mis-
ry Tour through Hawaii," mentions some remarkable
articulars regarding the superstitious observances

company making high charges, and consequently good profits, may be supposed to have more stability than one making moderate charges; while, of a society pursuing business on the same plan, it may be said that the overplus becomes a kind of bank deposit, to be ultimately realised by the depositor. With regard to companies, the defence may or may not be sound, according as business is managed discreetly or otherwise —and there certainly are offices of that nature, entitled to the most implicit confidence, although they present moderate scales. The defence is of greater force with regard to societies; but even there it is not free from

	25	30	35	40	45	50	55
4 per cent.,	L.1 10 4	L.1 15 1	L.2 0 5	L.2 7 6	L.2 15 6	L.3 7 3	L.4 5
3½ per cent.,	1 12 1	1 16 11	2 2 5	2 9 7	2 17 10	3 9 9	4 8

The rates actually charged by the offices which we have cited, may easily be compared with these. It will be found that the additions made for management and the security of the concern, even to the 3½ per cent. rate, are very considerable. The aggregate of the above ages at 3½ per cent., is £18, 16s. 9d.; that of the same ages by the actual rate of the Aberdeen Company, is £21, 4s. 11d., or nearly 12¾ per cent. higher; that of the same ages by the Scottish Widows' Fund, is £24, 7s. 11d., or 29½ per cent. higher; while that of the London Amicable, is £25, 11s., or above 35½ per cent. higher.

MORAL DUTY OF LIFE-ASSURANCE.

On this subject we add some remarks from a paper in *Chambers's Edinburgh Journal*, No. 373. They are conveyed in language which is apt to appear unmeasured to one who has not given the subject much consideration—but, we believe, *only to him*.

"Such being the equitable and beneficial principles on which mutual-assurance societies are established, it is clear that they present, to men in the enjoyment of income, but possessing little property, a most suitable and favourable means of providing, in a greater or less measure, for the endeared and helpless relatives who may survive them. That only about 30,000 persons in possible to transact perfectly safe b dium of that scale. Those who, f prefer the next scale, must be said if they resort to a company which profits to the assured: if they bec society, large periodic additions to more than their due.

In order to convey still more distin ing rates of life-assurance, we subjo which are required, exclusive of ex ment, upon the Carlisle tables, takin at 4 and 3½ per cent.:—

vide, while he yet lives, for his own: it is not more his duty to provide fo during his life, than it is to provide, against their being left penniless in death. Indeed, between these two essential distinction, for life-assurance much a matter of current expenditure part of his income can be devoted by to the necessities of the present; and up, by means of life-assurance, to p future. And thus he may be said t his duty towards his family, instead the case, only doing the half of it.

It may be felt by many, that, ad in full, income is nevertheless insu them to spare even the small sum annual premium for life-assurance. of the present are in their case so g not see how they can afford it. We be no obstacle which is apt to appea this, where an income is at all limit easy to show that no obstacle could b will readily be acknowledged by eve an income at all, that there must b smaller incomes. Say, for instance

and many of them, who would no doubt recover their diseases if proper attention were paid to are literally starved to death, or devoured by s at night.

ongst the degrading doctrines of the Hindoo faith, ration for and even a worship of members of the creation, is not the least remarkable. The cow, ticular, commands the most exalted reverence; his venerable quadruped may be seen in cities ring up and down in the most public places, pering at her ease, and calling forth expressions of pre- respect. The monkey likewise ranks amongst gher grade of animals, and is allowed to roam at wherever he lists—a chartered thief, now laying shopkeeper's sweetmeats under tribute, and anon the fruiterer for a portion of his juicy store. is superstition reaches its climax in the hospitals are erected for affording shelter and succour to ed infirm brutes, including lice, fleas, and other s. It must be an exceedingly nice investigation see who preside as medical attendants over such itions, to determine the state of health of such ts. Other animals besides these are held sacred, me quadrupeds are treated with great cruelty. raught horses, in particular, Bishop Heber in- es, are barbarously abused; nor is there much thy shown to human beings, who are allowed to from disease or hunger under the canopy of n, without awakening a sigh in the bosoms of the ers. Lepers are regarded as objects of divine , and are treated accordingly, sometimes being d or buried alive.

peculiar character of the Hindoo creed is derived their tenet respecting the transmigration of souls. pirits of the dead are said to enter a receptacle ponding to the previous character of the indi- . The immortal part of the just and good, how- nsignificant the person may have been, migrates hermit, a Brahmin, a demigod, and so forth, in dignity according to the degree of merit. The l, on the other hand, not only are degraded as beings, but are compelled to lodge in the bodies nals. The Hindoo oracles endeavour to establish e of conformity between the punishment awarded fences committed. The pilferer of grain is meta- osed into a rat, and he who eats fruits or roots es an ape. Others are degraded into worms, in- and so on. The person thus lowered in the scale ation, must pass through a long succession of de- l births before he can re-assume the human form. ystem of rewards and punishments, although con- to the earth, does not exclude the belief of a and a hell hereafter. The celestial mansions, ose of the Mahometan, are replete with objects uptuous enjoyment; but only Brahmins and per- f high attainments or great sanctity are permitted r these blissful abodes. Some ardent devotees to a higher destiny, and hope to be absorbed into ence of the supreme being, where they shall repose r on an unruffled sea of bliss. The place of final ment, in like manner, consists of different com- ents, the penalties inflicted in which correspond iniquities of those who are doomed to enter their precincts.

devotion of the Hindoos consists in a system emonious observances, not only troublesome in ives, but encroaching on the moral duties, nay, hole business of life. Such a stock of atoning is by this means conferred, that the weightier s of the law seem to be superseded; at all events, ternal devotion is not inconsistent with the most dious crimes. The observances commence in the g with ablutions and prayers, the worship of the sun, in the inaudible recitation of their holy s, in meditation, and the like. The five sacra- are then performed, which are, teaching and g the sacred books, offering cakes and water, an n of fire, in giving rice and other food to beasts, ves, and in receiving guests with honour. The

images of the gods who constituted the guardians of the tabooed places of sepulture, are described as figures oddly carved in pieces of wood; these were stuck on the fences and trees of the enclosure, and with their horrid aspect and ragged garments, seemed no improper emblems of the system they were designed to support. Adjoining the sacred enclosure, the author was shown a *Pahu Tabu*, or city of refuge, which was open for the reception and security of all classes of delinquents, and resembling in its regulations the sanctuaries of antiquity. These, and some other circumstances mentioned by Mr Ellis, open an interesting field for speculation on the probable connexion of ancient and modern superstitions, or at least on the similarity of the delusions by which the untutored human being has in all ages been affected.

Fetishism has long been practised among the Negroes of the West Indies, under the name of *Obeah* or *Obi*—a term most likely originating in Egypt and the adjacent parts of Africa, where anciently there was a deity of a demoniacal character, with the name Ob, or Oub, and from which Moses commanded the Israelites to abstain from making inquiries. Obi is therefore one of the exploded oracles of the ancient world, which has been carried by captured Negroes to the West Indies, and there set up as an oracle and the patron of incantations, charms, and all other superstitious delusions. The adepts who practise this kind of fetishism are called Obeah-men, or Obeah-women, for both sexes engage in the mysteries of this species of jugglery and imposture. We believe, that since the abolition of slavery in the West Indies, and the spread of education and Christianity, the practice of Obi has gone out of repute and notice.

At one period the religion of the Parsees or Fire-worshippers existed throughout Persia and other parts of Asia, but is now confined chiefly to the deserts of Caramania, towards the Persian Gulf, where it is followed by the Guebres or Giaours (infidels), as they are called by the Mahometans. The great prophet or improver of the Parsee religion was Zoroaster, who flourished about two thousand years ago, and taught the doctrines of there being an eternal spirit of Good or Light (Oramuzd), and an eternal spirit of Evil or Dark-

e third member of the Hindoo triad is Siva the oyer. It may be here remarked, that the distinuing appellations applied to these deities are not ther characteristic of their functions—Vishnu reserver frequently employing himself in acts of ction, and Siva on the other hand in acts of bence. But much vagueness, inaccuracy, and con-, prevail throughout the whole of the Hindoo ; and this no doubt arises from the love of the ellous and indescribable, by which they are led to at phantoms of thought as undefinable as they npalpable. Siva, it appears, has had an equal of personal adventure with Vishnu, although the cters which he assumed were not so various, nor xploits so important or striking. His female er is called Doorga, and to her the appellation of oyer is more applicable than to him. She is the amongst the female deities; in short, the most dable and warlike personage of the Hindoo pan-. She has rivalled Vishnu in the number of which she has assumed, and the conflicts in she has borne the most conspicuous part; and iants and others who have fallen victims to the ss of her arm, occupy a prominent place in old records of Hindoo mythology. As an ob-f adoration, the appearance which she is made sume shows a remarkable obliquity of moral in those who framed at first, and those who ip still, this horrible personage. Under the of Kalee, she is black, with four arms, wearing ead bodies as ear-rings, a necklace of skulls, and ands of several slaughtered giants circling her like a zone. Her eyebrows stream with blood; ot content, as the male divinities generally are, the simple productions of nature, her altars are to flow with the blood of animal oblations. Old ds even give directions how human sacrifices are offered to this cruel goddess. India has no deity popular, not only amongst banditti, who hold her pecial veneration, but with the more reputable s of the community, who offer lavish gifts on her . The disgrace of her religion consists in the ip of impure imagery, which it is impossible to on.

is unnecessary to enumerate even the more im-nt of the minor deities; as for the whole, they are ther innumerable. Some have taken the trouble kon up three hundred and thirty millions of them. are gods of the elements, of war, of the sun, of inds, of fire, of water, and so on. Every river, ain, and stream, is either a deity itself, or has one ling over it. The worship or deification of the es forms a distinguishing element in the belief of Hindoos. Into this large river, all who dwell a certain distance of its banks crowd morn-id evening to bathe; and the water of this sacred n is carried to all parts of India, and is sworn courts of justice. At Allahabad, where the ns of the Ganges and Jumna unite, the country many miles round is considered sacred ground; o great is the number of pilgrims who resort r for bathing, that the vizier has received in ear half a lac of rupees for permission to enjoy enefit of immersion in the sacred flood. Often-may be witnessed children hurrying their parents river side, fearful lest they should die before able to reach its banks. Nothing can be more sing to the feelings than to behold these poor ng creatures, some calling upon Rham, some one of their false gods, others upon another, with bodies half in the water and half out, the rising oon to overwhelm them. Many are laid where le cannot reach them, and their case is more piti-till. Beneath a burning sun, they are left without food, and many of them, who would no doubt recover from their diseases if proper attention were paid to them, are literally starved to death, or devoured by jackals at night.

Amongst the degrading doctrines of the Hindoo faith, a veneration for and even a worship of members of the brute creation, is not the least remarkable. The cow, in particular, commands the most exalted reverence; and this venerable quadruped may be seen in cities sauntering up and down in the most public places, perfectly at her ease, and calling forth expressions of profound respect. The monkey likewise ranks amongst the higher grade of animals, and is allowed to roam at large wherever he lists—a chartered thief, now laying the confectioner's sweetmeats under tribute, and anon taxing the fruiterer for a portion of his juicy store. But this superstition reaches its climax in the hospitals which are erected for affording shelter and succour to sick and infirm brutes, including lice, fleas, and other insects. It must be an exceedingly nice investigation for those who preside as medical attendants over such institutions, to determine the state of health of such patients. Other animals besides these are held sacred, but some quadrupeds are treated with great cruelty. The draught horses, in particular, Bishop Heber informs us, are barbarously abused; nor is there much sympathy shown to human beings, who are allowed to perish from disease or hunger under the canopy of heaven, without awakening a sigh in the bosoms of the onlookers. Lepers are regarded as objects of divine wrath, and are treated accordingly, sometimes being burned or buried alive.

The peculiar character of the Hindoo creed is derived from their tenet respecting the transmigration of souls. The spirits of the dead are said to enter a receptacle corresponding to the previous character of the individual. The immortal part of the just and good, however insignificant the person may have been, migrates into a hermit, a Brahmin, a demigod, and so forth, rising in dignity according to the degree of merit. The wicked, on the other hand, not only are degraded as human beings, but are compelled to lodge in the bodies of animals. The Hindoo oracles endeavour to establish a degree of conformity between the punishment awarded and offences committed. The pilferer of grain is metamorphosed into a rat, and he who stole fruits or roots becomes an ape. Others are degraded into worms, insects, and so on. The person thus lowered in the scale of creation, must pass through a long succession of degraded births before he can re-assume the human form. This system of rewards and punishments, although confined to the earth, does not exclude the belief of a heaven and a hell hereafter. The celestial mansions, like those of the Mahometan, are replete with objects of voluptuous enjoyment; but only Brahmins and persons of high attainments or great sanctity are permitted to enter these blissful abodes. Some ardent devotees aspire to a higher destiny, and hope to be absorbed into the essence of the supreme being, where they shall repose for ever on an unruffled sea of bliss. The place of final punishment, in like manner, consists of different compartments, the penalties inflicted in which correspond to the iniquities of those who are doomed to enter their dismal precincts.

The devotion of the Hindoos consists in a system of ceremonious observances, not only troublesome in themselves, but encroaching on the moral duties, nay, the whole business of life. Such a stock of atoning merit is by this means conferred, that the weightier matters of the law seem to be superseded; at all events, this external devotion is not inconsistent with the most scandalous crimes. The observances commence in the morning with ablutions and prayers, the worship of the rising sun, in the inaudible recitation of their holy writings, in meditation, and the like. The five sacraments are then performed, which are, teaching and studying the sacred books, offering cakes and water, an oblation of fire, in giving rice and other food to living creatures, and in receiving guests with honour. The

killing a friend, and drinking forbidden liquor with killing a Brahmin. A particular class of devotees, called *yogues* or *fakirs*, signalise their piety by enduring the severest tortures with a firmness and perseverance worthy of the holiest cause. These consist in burying themselves in the depths of forests, either in a state of perfect nakedness, or having their bodies coated with ashes and cow-dung; in allowing the nails of their hands and feet to grow till they assume the dimensions and appearance of bird's claws; roasting themselves before huge fires; immuring themselves in the ground, and leaving only a small breathing-hole; going about with small spears or rings pierced through the most tender parts of the body, and hot irons applied to the side; holding their hands above their head till they have lost the power of bringing them down again, and become withered like that of the individual mentioned in the Evangelists; clenching the fists till the nails penetrate the palms; turning their faces to the sun till they cannot regain their natural position, or gazing on his intense blaze till their eyesight is extinguished; lying on iron spikes; tearing the flesh with whips; chaining themselves for life to the foot of a tree; and performing other such-like acts of slow suicide. Some of their attitudes are exceedingly fantastical; for instance, Bishop Heber saw a devotee hopping about on one foot, having made a vow never to put the other to the ground, which was now shrivelled up, contracted, and useless. Begging holds a conspicuous place among the religious duties of the Hindoos. Mr Ward affirms that an eighth part of the inhabitants of Bengal and Bahar subsist in this manner; thus constituting a mendicant population of upwards of two millions. Religious pilgrimages are held in high esteem, and the holy places have generally been established near the sea, the sources and junctions of rivers, the tops of remarkable hills, hot springs, caves, waterfalls, and places of difficult or dangerous access. All the principal roads are crowded with people hastening to these holy places. Some are held in higher veneration than others, and it is no uncommon occurrence, in the crush and tumult of the multitude to reach these Bethesdas, for numbers

often been supposed that Boodhism resembles
ism or Hindooism, which is a great mistake.
ystems can be more opposite or bear less evi-
being derived from each other. Brahminism
rmations, but Boodhism admits of none, for it

whence it extended into China.

The most extraordinary peculiarity of Boodhism is the want of any existing God. Adoration or respect is merely paid to the image of Gaudama, who was a god at a former period, but is now annihilated, or entered into annihilation. Gaudama was the son of a king, and born about 626 years before the commencement of our era. He had previously lived in four hundred millions of worlds, and passed through innumerable conditions in each. In *this* world he had been almost every sort of worm, fly, fowl, fish, or animal, and in almost every grade and condition of human life. Having in the course of these transitions attained immense merit, he at length was born son of the above-named king. The moment he was born, he jumped upon his feet, and, spreading out his arms exclaimed, 'Now am I the noblest of men! This is the last time I shall ever be born!' His height, when grown up, was nine cubits. His ears were so beautifully long, as to hang upon his shoulders; his hands reached to his knees; his fingers were of equal length; and with his tongue he could touch the end of his nose! All which are considered irrefragable proofs of his divinity.

When in this state his mind was enlarged, so that he remembered his former conditions and existences. Of these he rehearsed many to his followers. Five hundred and fifty of these narratives have been preserved—one relating his life and adventures as a deer, another as a monkey, elephant, fowl, &c. &c. The collection is called *Dzat*, and forms a very considerable part of the sacred books. These legends are a fruitful source of designs for Burman paintings. Of these I purchased several, which do but bring out into visible absurdity the system they would illustrate.

He became Boodh in the thirty-fifth year of his age, and remained so forty-five years, at the end of which time, having performed all sorts of meritorious deeds, and promulgated excellent laws, far and wide, he obtained 'nie-ban,' that is, entered into annihilation, together with five hundred priests, by whom he had been long attended. This occurred in Hindostan, about 2380 years ago, or B.C. 546. At his death he advised that, besides obeying his laws, his relics and image should be

d prosperity, during a hundred transmigra-
r those of the second class, the same during a
transmigrations; for the third, the same
en thousand; for the fourth, a vastly greater
but indefinite, being graduated according to
ce of sanctity the particular priests may pos-

discourses said to have been delivered by Gau-
e given in the Bedagat. In these, the duties
s, children, husbands, wives, teachers, scholars,
slaves, &c., are drawn out and urged in a
which would do honour to any casuist.

llowing is part of one of these, addressed to a
shed personage, who sought his instruction how
evil:—

w thou, that to keep from the company of the
, and choose that of learned men; to give honour
it is due; to choose a residence proper to our
and adapted for procuring the common wants
and to maintain a prudent carriage, are means
rve a man from evil doings. The comprehen-
ll things that are not evil, the exact knowledge
ities of our station, and the observance of mo-
d piety in our speech, are four excellent modes
ncing wickedness.

nistering a proper support to parents, wife, and
y purity and honesty in every action, by alms-
y observing the divine precepts, and by succour-
ions, we may be preserved from evil. By such
m from faults, that not even the inferior part
ature manifests any affection for them, by ab-
from all intoxicating drink, by the continual
of works of piety, by showing respectfulness,
, and sobriety before all, and gratitude to our
ors; and, finally, by listening often to the
g of the word of God, we overcome evil incli-
and keep ourselves far from sin. Docility in
g the admonitions of good men, frequent visits
ts, spiritual conferences on the divine laws,

patience, frugality, modesty, the literal observance of the law, keeping before our eyes the four states into which living creatures pass after death, and meditation on the happy repose of nic-ban—these are distinguished rules for preserving man from wickedness.'

Pagodas are innumerable. In the inhabited parts there is scarcely a mountain peak, bluff bank, or swelling hill, without one of these structures upon it. Those of Pegu and Siam are all formed upon one model, though the cornices and decorations are according to the builder's taste. In general they are entirely solid, having neither door nor window, and contain a deposit of money, or some supposed relic of Gaudama. From the base they narrow rapidly to about mid-way, and then rise with a long spire surmounted with the sacred tee. Some of those around Ava, and especially those at Paghan, are less tapering, and more resembling temples.

Zayats are not exclusively religious buildings. Some are intended to contain idols, and some are for the accommodation of worshippers and travellers, and for town-halls. The majority contain no idols, and are intended only to afford shelter for worshippers and travellers. Some of these are mere sheds, open on all sides; but in almost all cases they are built in a far more durable and costly manner than dwelling-houses.

Every village has a zayat, where the stranger may repose or stay for many days, if he please; and many a time I found them a comfortable lodging-place. Like the chultries of Hindostan, they are of unspeakable utility in a country destitute of inns, and where every house has its full complement of inmates. Many zayats, especially near great cities, are truly beautiful, and very costly. The ceilings and pillars are not only elaborately carved, but completely gilded, and the stucco floors rival marble in hardness and polish.

Worship is not performed collectively, though crowds assemble at the same time on set days. Each one makes his offerings and recites his prayers alone. No priests officiate; no union of voice is attempted. On arriving at the pagoda, or image, the worshipper walks reverently to within a convenient distance, and laying his offering on the ground, sits down behind it, on his knees and heels, and placing the palms of his hands together, raises them to his forehead, and perhaps leans forward till his head touches the ground. This is called the *sheeko*. He then utters his prayers in a low tone, occasionally bowing as before; and having finished, rises and carries forward his gift, laying it somewhere near the idol or pagoda. Some proceed first to one of the great bells which hang near, and strike several times with one of the deer's horns which always lie beneath. When one goes alone, this is seldom omitted. There are four set days in every lunar month on which the people assemble in greater numbers at the pagodas to offer their individual prayers. These days are at the new and full moon, and seven days after each; so that sometimes their Sabbath occurs after seven days, and sometimes after eight.

Boodhist priests are not a caste or hereditary race. Any one may become a priest, and any priest may return to a secular life at pleasure. Thousands, in fact, return every year, without the least reproach. On becoming a priest, a yellow robe is assumed, and celibacy, with numerous mortifications, is enjoined. Their office may be called a sinecure, as they seldom preach or perform any service, except teaching and giving special religious advice. They are of different degrees of rank, and subsist entirely on the contributions of the people. Their number is very great. Ava, with a population of 200,000, has 20,000 priests.

Boodhist priest.

In point of moral obligation, and the inculcation of purity of life, Boodhism is infinitely superior to Hin-

doonism. It has no mythology of obscene and ferocious deities, no sanguinary or impure observances, no self-inflicted tortures, no tyrannising priesthood, no confounding of right and wrong, by making certain iniquities laudable in worship. In its moral code, its descriptions of the purity and peace of the first ages, of the shortening of man's life because of his sins, &c., it seems to have followed genuine traditions.

At the same time, we must regard Boodhism with unmeasured reprobation, if we compare it, not with other false religions, but with truth. Its entire base is false. It is built, not on love to God, nor even love to man, but on personal merit. It allows evil to be balanced with good, by a scale which reduces sin to the shadow of a trifle. To sheeko to a pagoda, or offer a flower to the idol, or feed the priests, or set a pot of cool water by the wayside, is supposed to cancel a multitude of sins. The building of a kyoung or pagoda will outweigh enormous crimes, and secure prosperity for ages to come. Vice is thus robbed of its terrors, for it can be overbalanced by easy virtues."

LAMAISM.

In Thibet, Tartary, and other parts of central Asia, inhabited by the Mongolian race, Boodhism assumes a different form and name, being more a religion of pure priestcraft and external observance, and including a belief in the continual personal presence of a supreme God. This branch of Boodhism, as it is believed to be, is usually called Lamaism, the word *Lama* literally signifying priest. Like Boodhism, this religion acknowledges no eternal, self-existent being. The idols, to the number of a hundred and eight, are representatives of created beings, who ascended into the rank of gods before the present world was created, on account of their holiness. The chief god is Shigemooni, who appeared in the world for the last time a thousand years before the Christian era, and then instituted Lamaism, with a visible living representative or appearance of himself, called Dalai-Lama, or the Great Lama. The worship of this Grand Lama, therefore, is a principal feature in the system of belief.

It is understood and inculcated, that when the Grand Lama expires in the course of nature, his spirit immediately takes possession of some other body in a supernatural manner, which it is impious to inquire into, and is only comprehended by the attendant priests. In point of fact, the religion which inculcates this absurdity is idol worship under a different name, the idol being a living creature instead of an inanimate object, as in ordinary paganism; and the whole system seems to have been devised in order to support a numerous host of priests and religious establishments.

Dalai-Lama, or the Grand Lama, is at the head of both ecclesiastical and secular affairs in Thibet, which may be considered a theocratical state. The usual residence of the Dalai-Lama is in two monasteries situated in the vicinity of the capital, Lassa, in each of which he dwells alternately. He is surrounded in every direction by a vast number of priests; but no woman is permitted to pass the night in the building where he lodges. This arises, undoubtedly, from the purity which is attributed to him, for he is called the *immaculate*. The natives, as well as a great crowd of foreigners (for all the Mongol tribes in Russia acknowledge him), undertake fatiguing pilgrimages in order to pay their homage to him, and obtain his blessing. He receives them sitting upon a kind of altar, upon a large and splendid seat, with his legs crossed. The Tartars, next to the inhabitants of Thibet, pay him the greatest reverence. They come to him from the most distant regions, and the princes, to whom he shows no more respect than to others, submit to the same ceremonies as their people. He salutes no one, never uncovers his head, rises up before no one, and is satisfied with laying his hand upon the head of his worshipper, who believes that he has thereby obtained the pardon of his sins. His worshippers believe that the supreme divinity lives in him, that he knows and sees every thing in the deepest recesses of the heart, and never needs to make [illegible] in regard to any thing. If he does this, it is [illegible] unbelievers and the evil-minded may not [illegible] for complaint. He sometimes distributes, it [illegible] little balls of consecrated dough, which the Tar[illegible] in many superstitious practices; but it is not [illegible] balls made from his excrement are distribute[illegible] served in golden boxes, and even mixed with [illegible] of food. His power was once greater than it [illegible] and he appointed and deposed the khans; but [illegible] sent he is dependent on the Emperor of China, [illegible] the latter, in a religious respect, is subjected [illegible] Two Chinese mandarins, with a garrison of 10[illegible] nese, are maintained in his capital, and, in the [illegible] at Pekin, the Chinese Emperor supports a suba[illegible] Lama, who is sent as a nuncio from Thibet.

When the Dalai-Lama dies, it is then neces[illegible] discover where his spirit has chosen to be bor[illegible] In this case all must submit to the opinion of [illegible] the Lamas, who alone are acquainted with the [illegible] which he may be known, or, rather, who kn[illegible] child the deceased has appointed for his su[illegible] The worshippers of the Lama are divided, in[illegible] into two sects, known by the titles of the *yel[illegible] red caps*. Each sect is under three Lamas; [illegible] mer is under the Dalai, Teeshoo or Bogao, as[illegible] naut Lamas; the latter, under the three sha[illegible] The Dalai-Lama is the most distinguished of [illegible] next to him is the Teeshoo-Lama, who dwells [illegible] shoo-Loomboo, ten days' journey from Lassa[illegible] three shammars dwell in separate monasteries, t[illegible] distinguished of which is at Tassasudon, the ca[illegible] Bootan. Subordinate to them are numerous pr[illegible] different ranks, who are held in great respe[illegible] superintend instruction, and some of whom li[illegible] state of celibacy, according to certain rules, sim[illegible] those of the Christian monks. At Lassa alon[illegible] are 3000 monasteries.

MAHOMETANISM.

The religion of Mahomet, or Mahomed, and Mahometanism, partakes of a much more exalt[illegible] racter than any of the mythological superstiti[illegible] ready adverted to, inasmuch as it approaches [illegible] theism, or a belief in the one true God. This [illegible] religion, which now prevails in Arabia, Egy[illegible] Moorish states, Turkey, Persia, and is extende[illegible] scattered manner over south-eastern Asia, and n[illegible] 100,000,000 of followers, originated in Arabia [illegible] beginning of the seventh century of the Christia[illegible]

At this period, eastern countries were in a cond[illegible] receive a new and vigorously conducted form of re[illegible] belief. The scattered branches of the Christian [illegible] in Asia and Africa were at variance with each [illegible] and had adopted the wildest heresies and superst[illegible] They were engaged in perpetual controversies, an[illegible] to pieces by the disputes of the Arians, Sabellians[illegible] torians, and Eutychians; whilst the simony, the [illegible] tinence, and general barbarism and ignorance [illegible] were to be found amongst the clergy, caused [illegible] scandal to the Christian religion, and introduced [illegible] versal profligacy of manners amongst the people. [illegible] Christianity, in the manner it was abused by [illegible] lightened followers, was of little avail in civilisi[illegible] Asiatics, while the religion of the Jews was sun[illegible] comparative insignificance, and while paganism [illegible] flourished in the east, Mahometanism was intro[illegible] upon the scene, and in a wonderfully short per[illegible] time, gave an entirely new cast to manners and [illegible] of belief. Arabia being the country in which thi[illegible] religion was first promulgated, it is considered [illegible] able to mention the nature of the religion whic[illegible] people previously professed and now abandoned.

"The ancient Arabs are supposed to have been [illegible] are termed pure theists; that is, they are suppo[illegible] have believed in and worshipped one sole, omnip[illegible] and everlasting God. Historians, however, hav[illegible] dom correctly appreciated the meaning of these m[illegible] ficent expressions in the mouth of a savage.

et hour, by a sacrifice of sheep and camels, urial of their hair and nails in the consecrated ". The Arabians had many other superstitions ; they held their women in a degraded rank, nd, though refined in some points of manners, no written law, were governed despotically and were really barbarians and idolaters. It ebased religion of this people which Mahomet to improve, and we have now to see who this bold and ingenious man was, and how he is plans into execution.

et was born at Mecca, the capital city of Felix, A.D. 569, during the reign of Nouschirwan the Just, King of Persia. He was of the Hasebem, and of the tribe of the Koreish, the Arabia. His father Abdallah was a younger dalmotalleb, and dying very young, and in his fetime, left his widow and infant son in very cumstances, his whole substance consisting e camels and one Ethiopian female slave. Abeb was therefore obliged to take charge of his d Mahomet, which he not only did during his t his death enjoined his eldest son, Abu Taleb, brother to Abdallah by the same mother, to ir him for the future. This was very ably performed by Abu Taleb, who instructed him siness of a merchant, which he followed; and d he took young Mahomet into Syria when ut thirteen years old, and afterwards recommim to Khadijah, a noble and rich widow, for r, in whose service he behaved so well, that, g him her husband, she soon raised him to an with the richest in Mecca.

after he began, by this advantageous match, his ease, that he formed the scheme of estaa new religion, or, as he expressed it, of re- the only true and ancient one professed by oah, Abraham, Moses, Jesus, and all the prodestroying the gross idolatry into which the of his countrymen had fallen, and weeding orruptions and superstitions which the latter Christians had, as he thought, introduced religion, and reducing it to its original purity, sisted chiefly in the worship of one only God. pan began to affect solitude, usually retiring th in the year to a cave in Mount Hara, near He had indisputably a very piercing and ellect, and was thoroughly versed in all the sinuation. The eastern historians describe ve been a man of an excellent judgment and memory; and these natural parts were ine y a great experience and knowledge of man- the observations he had made in his travels. resented as a man of few words, of an equal, emper, pleasant and familiar in conversation, sive behaviour towards his friends and acses, and of great condescension towards his ; to all which were joined a comely agreeable nd a polite address—qualities of no small n prepossessing those in his favour whom he l to persuade.

n the prophet was about four years old," says the Arabian,† "accompanying the sons of his n the field, the blessed child retired into a cave, nt of the mountain Uriel, to pray, when the l Gabriel appeared to him, and said, *Bismillar rahimi*; that is, 'In the name of God, compasnd merciful, O child greatly beloved, I am sent t from thy heart the root of evil; for thy Lord made the gates of Paradise to fly open!' The signed one said, 'The will of thy Lord and bene.' Then the angel opened his breast with adamant, and, taking out his heart, squeezed the black contagion which was derived from nd having put the child's heart in its place blessed him, and retired to the invisible

that the Angel Gabriel had appeared to him in glory, and declared that God had commissioned him as an apostle to reform the world; *that he then delivered to him the Koran for a divine law,* which should complete all antecedent revelations. Khadijah gained for her husband an important proselyte in her uncle Waraka, a Christian, who was well read in the Old and New Testaments. He pronounced Mahomet "*to be the great prophet foretold by Moses the son of Amram.*" It is much more probable that Waraka was the assistant of Mahomet in composing the Koran than Sergius the monk, or any other person.

The next proselyte was Abubeker, a rich and respectable inhabitant of Mecca; and his example being followed by many others, Mahomet ventured on a bolder demonstration of his mission. At a numerous assemblage of the Koreishites, at a public entertainment to which he had invited them, he demanded who would become his vizier, or prime minister, assuring them that both happiness in this world and in that to come would accrue to his followers. The guests remained silent in surprise, when Ali, the son of Abu Taleb, a boy about fourteen years of age, started up enthusiastically, and said, "I will be thy vizier, oh Prophet of God! I will break the teeth, pluck out the eyes, rip up the belly, cut off the legs of thine enemies." The joy and approval testified by Mahomet to the zeal of his youthful disciple, was an apt and early specimen what manner of spirit he and his deputy were of. The hostile proceedings and denunciations of the prophet against their idolatry, at length aroused the enmity of the Koreishites; but their threats were despised by him, and, in reply to the prudent remonstrances of his uncle Abu Taleb, he exclaimed, "Though the Koreishites should arm against me the sun and the moon (alluding to the divinities whom they ignorantly worshipped), the one on my right hand, and the other on my left, I would not be shaken from my resolution." He, however, retired for a while to a castle in Mount Safa, and his followers were banished from the city of Mecca. After this persecution, which lasted five years, in the tenth year of his mission (A.D. 618), he sustained a serious

ance of his faith, were ratified subsequently on the hill El Safa. Having visited the holy building of the Caaba, and broken in pieces the idols wherewith it was encircled, Mahomet went in procession seven times round the building, and touched respectfully the black stone which was held sacred by the Arabs; then entering the edifice, he repeated the formulary, "*God is great.*" Afterwards he went to the well Zemzem—which is believed by them to be the same that the angel showed to Hagar—drank of the water, and performed the required ablution. Artfully blending attention to exterior observances with zeal, and pursuing a mixed system of mercy and rigour, he subdued the hearts of his high-minded countrymen, and soon superadded to his claims of power the more imposing and indissoluble bonds of superstitious reverence and awe. The capture of Mecca, and the submission of the powerful race of the Koreish, was soon followed by the conversion to Islamism of most of the remoter pagan tribes, until all Arabia bowed the neck beneath his yoke.

Mahomet, having thus become master of all Arabia, made great preparations for the conquest of Syria; but this vast enterprise was reserved for his successors. He gradually, however, paved the way for their successes, and brought the celebrated region of Arabia into one complete and powerful union. He established the law which still obtains in all the Mussulman states, of imposing a personal tax on such subjects as do not embrace Islamism. By this custom, still subsisting among all the sovereigns who acknowledge the Koran, every reputed infidel pays a *kharaj*, or capitation-tax, over and above the imposts which he supports equally with the rest of the subjects. He absolutely prohibited all idolators from making the pilgrimage to Mecca, or any foreigner from entering the Caaba, under pain of death. These were strokes of profound policy. He retained the pilgrimage to Mecca, which had been of ancient standing among the descendants of Abraham and Ishmael. Though he destroyed the images used at Mecca as objects of idolatrous worship, he carefully retained the holy relics of the black stone and the supposed impression of Abraham's foot. The black stone had been immemorially venerated there; the angels, the close of his extraordinary and for

e dead person to sit upright, and examine him
ing his faith in the unity of God and the mission
met. If he answer correctly, his body is allowed
rest, and is refreshed with the air of paradise;
appear sceptical, they beat him on the temples
n rods, till he cries with anguish so loud as to
d by all except men and genii. As to where the
ells after death, the Mahometans seem to have
y of opinions, which need not be particularised.
etans are also divided as to the nature of the re-
on, some believing that it will be merely spiri-
ers that the body only will be raised; but it is
that all who have ever lived will appear for
nt. It is likewise believed that the irrational
will be judged at the resurrection, and weak
will take vengeance on the strong until satis-
is given to the injured. The Koran enjoins
s to all animals whatsoever, although it pro-
some to be unclean; and it is allowed that the
of Mahometans in this respect far excels that
enerality of Christians.
supposed by the more orthodox Mahometans,
books wherein the bad actions of a man are
ed will be put into one scale, and the good into
; and according as these preponderate, sentence
given. After this will follow the satisfaction
ery one takes of his fellow, or the retaliation
them for the injuries they have received. The
of giving this satisfaction will be to take away
e man a portion of his good works and give to
whom he has injured. "What, never, never?"

grees of sinners." The first is destined to receive the wicked Mahometans, the second for the Jews, the third for the Christians, and the rest for other sects and unbelievers. Over these will be placed nineteen angels, to whom the condemned will confess the justness of God's sentence, and beg them to intercede with him in their behalf. The punishment of infidels will be continued for ever, but wicked Mahometans will be released after a certain period of suffering.

Before entering paradise, the righteous will drink at the pond of Mahomet, which is supplied with water from the rivers of paradise. It is described as a month's journey in compass, and whoever drinks of the water will thirst no more. It is a matter of keen dispute whether paradise is already created, many supposing that it will be different from the paradise in which Adam was placed. The more orthodox opinion, however, is, that it is the same, and that it was created before the world. It is supposed to be situated above the seven heavens, immediately under the throne of God, and is described as a place of great beauty. The trunks of the trees are of gold, one of which, the tree of happiness, will yield all sorts of fruit for the consumption of true believers.

God's absolute decree and predestination of both good and evil, is a doctrine which Mahomet always took occasion to impress upon his followers. He said that God had not only predetermined the adverse or prosperous fortune of every person in the world, but also his faith or infidelity, which fate it is impossible by any foresight to avoid. By this doctrine, Mahomet taught his followers to have the greatest contempt for danger, which was of material service to him in the propagation of his creed.

Of the four points of religious practice required by the Koran, prayer is the first. Mahomet included under this act purifications of the body, by total immersion at certain periods, and by washing the face, hands, and feet, at others. To make his followers punctual in the observance of these purifications, Mahomet declared that the practice of religion is founded on cleanliness, without which prayer would not be heard by God. A

tice of Mahometans. These consist o

f the worst features of the Mahometan faith is aded position which it assigns to women. This, forms a radical error in the constitution of so- Mahometan countries, and must be removed ere can be a steady advance in refined ci- ot. Women are considered in every respect to men. Few of them, even among the highest receive any instruction; they are carefully se- rom public observation; assigned in marriage their own consent, on payment of a trifling sum of dowry; and are divorced at pleasure—all ods to debase their minds, and to produce the d of social vices. Polygamy and legal concu- dd to the evils caused by such practices. The llows a man to marry four wives, and to main- many concubine slaves as he may choose. He orce any of his wives at any instant which r passion may suggest, merely by uttering the words, "Thou art divorced!" and she must her parents or friends accordingly. He may again as a wife, and again divorce her; and orce her a third time, provided she has in the been married to and divorced from another r Lane, in his work on Egypt, says, that he n cases in which men have, in the course of a s, married as many as twenty or thirty wives; cases of women who had been married to a more men successively. In most instances, told, a man marries no more than one wife; ese practices are common, we can easily judge epravity of manners which prevails in those professing the Mahometan creed.

the manner in which females are treated, it n generally supposed by Christians that the tans believe that women have no souls. But mistake. Women are believed to have souls, not to be excluded from paradise, though they to perform offices of a subservient nature. most person in paradise, it is believed, "is to nty thousand servants, and seventy-two wives ls of paradise, besides the wives he had in this hat he is to inhabit a tent composed of pearls, and emeralds; at meals he will be served in gold; and he is to be at liberty to drink freely ne of paradise, which will not intoxicate." In mises of felicity, we have a striking proof of ideas of eternal happiness formed by the pre- well as of his knowledge of mankind.

oran forbids the use of wine or any intoxicating and this is among the best injunctions which it . Opium and other inebriating drugs are under- fall within the line of prohibition, though not d. The use, therefore, of either intoxicating drugs, is considered immoral in all Maho- ountries. Musulmans of all ranks are remark- their sobriety and temperance in food. The swine's flesh is strictly prohibited; and, indeed, mals forbidden to be eaten by the Mosaic law forbidden by that of Mahomet. All animals food must be killed by cutting their throat; and, rming the operation, the butcher must say, "In e of God! God is most great!" Gambling is hibited; also usury, and the making of any r pictorial resemblances of any thing that has rhaps the desire to extinguish idolatry influ- s prophet in laying down the last-mentioned stacy from Islamism is deemed a most heinous must be punished with death.

Mahometan creed enjoins no sabbath, like that the Jews or Christians, but selects Friday, as the week to be distinguished by more than

Levitical law, and also acquainted with the arrangements of the Christian church, it is remarkable that he instituted no order of clergy, but, on the contrary, left his religion to be professed by the people at large, without any distinction as to rank or qualification. On this account, Mahometanism has no priesthood, and cannot be said to constitute in any country what we understand by the term church. Wherever it is established as the religion of the community, *mosques* or chapels have been erected, generally by endowments from wealthy individuals; and these are individually under the charge of a warden, who is custodier of the revenues, and appoints the ministers of religion and inferior servants. "Two imams are employed to officiate in each of the larger mosques: one of them, called the *khateeb*, preaches and prays before the congregation on the Friday; the other is an *imam ratib*, or ordinary imam, who recites the five prayers of every day in the mosque, at the head of those persons who may be there at the exact times of those prayers: but in most of the smaller mosques both these offices are performed by one imam. There are also to each mosque one or more *muezzins* (to chant the call to prayer) and *bowwabs* (or doorkeepers); and several other servants are employed to sweep the mosque, spread the mats, light the lamps, and attend the water-wheel by which the tank or fountain, and other receptacles for water, necessary to the performance of ablutions, are supplied. The imams, and those persons who perform the lower offices, are all paid from the funds of the mosque, and not by any contributions exacted from the people. The condition of the imams is very different, in most respects, from that of Christian priests. They have no authority above other persons, and do not enjoy any respect but what their reputed piety and learning may obtain them: nor are they a distinct order of men set apart for religious offices, like our clergy, and composing an indissoluble fraternity; for a man who has acted as imam to a mosque may be displaced by the warden of that mosque, and, with his employment and salary, loses the title of imam, and has no better chance of being again chosen for a religious minister than any other person competent to perform the office. 48. NEW AND IMPROVED SERIES. PRICE 1½d.

SUPERSTITIONS.

have in all ages been prone to the most superstitions. The enlightened nations of rere no more exempted from them than the ant. The Jews, as we are repeatedly in- Scripture, could with difficulty be restrained trous and superstitious practices, and con- worship and service of the only true God. rkable tendency of the Hebrew nation was hood caused by their sojourn for the space ndred years among the Egyptians, whose m of religion was a mass of idolatrous ob-

They had a number of ideal gods to whom d temples of prodigious size and architectural the principal of these deities were Osiris hich are thought to have been typical of the on. But they also offered worship to various the ox or bull (hence the golden calf of the to which they gave the name of Apis; the lf, the hawk, the ibis or stork, the cat, and tures; they likewise paid adoration to the nifying it in the crocodile, to which temples ed, and priests set apart for its service. The notwithstanding their learning, also believed lucky and unlucky days, omens, charms,

In a word, they were grossly superstitious, o have had but a feeble conception, if any, which regulate the ordinary phenomena of

urdities of Egyptian superstition formed a hat followed among the Greeks and Romans, idea of an omnipresent and omnipotent God, and ruler of the universe. Their notions of e those of other pagans, were grovelling and le. The gods whom they adored were ima- ve been at one period rulers or heroes on still had their habitation somewhere within n territory, or at no great distance from it. ir belief in this vain mythology, both Greeks ns put faith in divination, oracles, the magical mulets, and dreams. Bees, ants, and various d beasts, were imagined to have the power of ns of good or bad fortune. The phenomena sphere and planetary bodies were likewise a ce of superstitious delusions. The appear- nets, and also eclipses, were ominous of great sters, it being the general belief that they al signs made by the gods to warn mankind hing troubles; in all which we see a lament- of the follies to which even a refined people posed, if ignorant of the laws of nature.

erstitious delusions of the Greeks and Ro- be said to have died out at the final dismem- the Roman empire, and the overrunning of rope by the Gothic nations. The introduc- istianity also tended powerfully to root out erstitious usages, though a few survived to s. For these reasons the superstitions and matters of credulous belief which afterwards affected the people of northern and western Europe, including the British islands, were in a great measure of Scandinavian and Gothic origin. The only superstitions of eastern growth worth mentioning, which were perpetuated in Europe generally, was that of astrology, or a belief that the stars exercised an influence over the destiny of mortals; and alchemy, or the pretended art of transmuting the baser metals into gold; both of which delusions finally vanished before the light of knowledge that spread abroad in the seventeenth and eighteenth centuries.

SCANDINAVIAN SUPERSTITIONS.

The superstitions of the European Northmen, or Scandinavians—under which term are included the early inhabitants of Denmark, Norway, Sweden, and Iceland —were of a kind remarkably accordant with the cold and stern character of the regions which they occupied. Like the ancient Greeks, the Scandinavians had seats of the gods and of the blest, which they called Asgard and Walhalla (or Valhalla), and these bore the same relation in their character to the Olympus and Elysium of the Greeks, that the countries of the north, with their stormy climes, their icy mountains, and perilous waters, bore to the perfumed and verdant plains of Hellas, and the fair blue skies overhanging the smooth Ionian Sea. Nothing could afford better proof of the utterly fanciful nature of all these mythologies, than the fact that they were thus modelled and modified in every case by the earthly habits, likings, territorial position, and ignorance of geography and astronomy, of the individual tribes among whom they respectively originated.

The deification of one or more great princes or rulers seems to have constituted the basis of the Scandinavian as well as of every other pagan mythology. Odin, the supreme deity of the Scandinavians, and the ruler of heaven and earth, appears, like the Hellenic Jupiter, to have been a distinguished chief and warrior of early times. Although it is asserted by some that a divinity of the name of Odin was worshipped from the most remote ages, there is reason to believe that the worship of this personage, in the north at least, had its real origin a few centuries before the commencement of the Christian era, when a powerful chieftain of the name was driven by the Romans from his dominions between the Euxine and Caspian, and took refuge in Scandinavia, the whole of which he subjected to his sway. Like Mahomet, this chief appears to have established a new religion, of which he himself assumed to be the earthly head, as the servant or minister of a divine being of the same name. In the course of time, however, this distinction was entirely lost, and the persons and acts of the divine and earthly Odin became inextricably blended in the mythology and traditions of the north. The great records of the religious and legendary knowledge of the

Scandinavians, are the Eddas and Sagas of Iceland, partly written in poetry and partly in prose. The oldest of the Eddas, a series of poetical fragments, was collected from oral tradition in the eleventh century, and the others are of later date. The acts of the deities and heroes of the north, the creation of the world, and prophetic revelations, form the general subject of these pieces.

The Scandinavians, like the Greeks, believed that the universe was originally a chaos, or mass of confused vapours, peopled by a race of Rimthursar, or evil spirits of gigantic bulk. A being of nobler nature sprang up among these, named Bure, from whom were descended Odin and his two brothers Vile and Ve. These younger divinities followed exactly the same course with the northern giants, that was pursued by Jupiter and his brothers with regard to the Titans, or older and gigantic deities of Greece. Odin began to war with the Rimthursar, and having at last overcome their great chief Ymer, he created the world out of that giant's body. His flesh became the mould, his bones the rocks, his hair the vegetable tribes, his blood the ocean, and his skull the heavens, at the four corners of which were placed certain dwarfs, called North, South, East, and West, whose duty it was to sustain the celestial dome. After this, the luminaries of the sky were set in their places, and the order of the seasons appointed. Natt (night) wedded one of the Aser, or celestial family of Odin, and gave birth to Dag (day). These deities travel alternately round the world in cars, drawn by single horses. Every great body, as in the Grecian mythology, was represented by a divinity. Frigga, or the earth, was the daughter of Odin, and also became his wife. The inhabitants of the earth, or mankind, were created by Odin and his brothers. Two pieces of wood, the one of ash and the other of elm, formed the materials of the first pair of mortals, who were distinguished for personal beauty and intellectual ability.

The race of deities inhabited Asgard, a place supposed by some to have been the city in Asia whence the real or mortal Odin was expatriated. The fabulous Asgard was pictured as containing numerous palaces and halls, the largest of which was the Mansion of Joy, where Allfader (Odin) sat on his throne amid his divine family. This throne was named Lidskialfa, or the Terror of Nations, and from it he could overlook the whole earth. Two ravens, Hugin (Spirit) and Muninn (Memory), sat always at his ear, and communicated to him intelligence of all things that were going on in the universe. Among the deities who dwelt in Asgard, one of the most important was Thor, or Asathor, son of Odin by Frigga, and the Mars, or warrior-god, of the Scandinavians.

Thor is described as the god of thunder, and the strongest of beings, earthly or heavenly. He is the son of Odin and Frigga, or, in other words, of the Sun and the Earth. When he moves, the earth trembles. He holds in his hand a powerful hammer, called the Crusher (*miölner*), with which he annihilates all who oppose him, and who offend the gods. In battle Thor is always girt with a magic girdle, which has the power of inspiring him with a divine fury, and redoubling his strength. On his right hand he wears an iron gauntlet, with which he grasps and wields the formidable crusher. This latter instrument was forged by a dwarf, named Sindri, the prototype of the deformed blacksmith-deities of the Greeks, Vulcan and his Cyclops. The hammer possesses the wonderful power of never missing its aim, and when launched at any object, returns to the hand of Thor, after having destroyed his foe. Thor is sometimes called Aukistor, or Thor of the Car, from his riding on a chariot, drawn by two powerful he-goats, named Sangniostr and Tangrisner. This deity has a spouse named Sipia, famous for her beautiful hair.

After Odin, Thor was the most cherished deity of Scandinavia, and had statues and temples erected to him everywhere. The statues of him were usually formed of clay, and represented a tall figure, with a red-painted beard, indicative of the lightning which he was supposed to wield. Bread and meat were s daily to the god by his worshippers, and at state libations were poured out in his honour.

Balder, the second son of Odin, was the most ful and amiable of the Aser or gods. Unlike t of his brethren, he was fond of peace, and had th of allaying tempests, and acting as a mediator, t divine wrath. His decrees were irrevocable. I points he resembled the Apollo of the Greeks, general qualities of that personage found a cl presentative in Braga or Bragi, the god of el and poetry. Niord, the god of the sea, and Freys, the god of rain, were also important de the north. Every element, or important natu nomenon, was under the guidance, in like ma some celestial personage. Frigga, the Scand Juno, was the bestower of fertility and plenty. or Freya, the daughter of Niord, was the Venu gard and the patroness of matrimony. Freia sisted in her duties by Siona and Sofna, the whom made lovers faithful, while the other re them when they quarrelled. Eyra was the ph of the gods. There were various other minor d in the Scandinavian mythology, though not m many as in the Grecian roll. The deficiency w up among the northerns by the assignment multitudinous duties to the greater deities. Th from the extent of his government, received a as one hundred and twenty distinct names, ea cating some individual quality ascribed to him.

The great hall appointed for the reception spirits of the brave, when they left earth for of the gods, was called Valhalla. Twelve beau terrible nymphs, named Valkyries (*choosers of th* were the guides of the good spirits to the hall halla, and supplied them with mead. The oc of drinking this northern nectar, and of eating of the wild boar Serimner, which, after servin daily food of thousands, became whole again night, filled up all those intervals of time in V that were not passed in fighting. None but th had shown surpassing bravery on earth were a into this Scandinavian paradise, and when ther daily amusement was to fight with one anothe or nearly all were cut in pieces. But little ha done in this way, for the spiritual bodies soon re and enabled the warriors to appear, entire in li limb, at the feasts that followed these extrao engagements. The skulls of enemies were the d cups used at the entertainments of Valhalla, guests are described as being almost perpetua state of inebriation. It was only when the e nounced the arrival of morning that these heroes arose from table, to issue to the field o through the five hundred and forty gates of V and hack each other to pieces anew. Such never-ending round of employment destined departed heroes of Scandinavia.

The mythology of the Scandinavians survive much later date than any other system of worship in Europe. It was not abolished eleventh century. St Olaf, King of Norway, zealous supporter of Christianity, usually recei credit of having overturned this most barbaro of religion. In the course of his efforts to Chri his subjects, he ordered a statue of Thor, pedestal on which it stood, to be broken in pie showed the people that the meat which had be down for the use of the god was not eaten by h by a host of rats and other vermin that had fo lodgement about the foundation of the colossal Whatever might have been the influence of the logy of the Scandinavians in Britain, it disap shortly after its overthrow on the continent of or only lingered in a kind of traditional ex amidst the remote islands of Orkney and Sheth finally banished by the progress of a more intelligence. The dread names of Odin, Tho other deities of the north, who for centuries w

down the human faculties, and kept up the reign of superstition, are now only perpetuated in the appellations affixed to some of the days of the week. Thus our term *Wednesday* is derived from Odin's or Wodin's day, that being the day of the week in which the northern Jupiter or supreme ruler of the gods was most honoured and worshipped. *Thursday* is from Thor, the second in dignity among these fabulous deities: as this day was called Dies Jovis by the Romans, we have here a confirmation that Thor the thunderer was equivalent either to Mars, or the thundering Jove of the Grecian mythology. *Friday* takes its appellation from Freya, the daughter of Niord, and corresponds with the Dies Veneris, or Venus day of of the Greeks and Romans. *Saturday* is derived in the same manner from the god Saeter of the Scandinavians, and Saturn of the Greeks. *Tuesday*, or anciently Tiesday (a pronunciation still preserved in Scotland), is supposed to be from Tisa, the wife of Thor, and the reputed goddess of Justice. *Sunday* and *Monday* were respectively named from the Sun and Moon, both by the northern and southern nations of Europe, from a remote period of time. The circumstance of there being such a marked resemblance between the characters of the deities whose names were employed to distinguish the same days of the week both by Greeks and Scandinavians, is not a little remarkable, and has never, as far as we know, been the subject of explanation by philologists or antiquaries. The fact is only certain, that the names of the days of the week now used by every civilised people, are based upon the mythological observances of either the Grecian or Scandinavian races.

ANGLO-SAXON SUPERSTITIONS.

At a comparatively early era, the mythology and minor superstitions of the Scandinavians, as well as the follies of Druidism, disappeared in Britain as the familiar superstitions of the Anglo-Saxon race became predominant. Like the Scandinavians of the north, the Anglo-Saxons deduced their descent from Odin, whom they worshipped along with Thor, Freya, and other imaginary deities of the Gothic people. They also worshipped idols emblematic of the sun, moon, earth, and various seasons and circumstances. In particular, they sacrificed to one goddess called Eostre, in the month of April, and her name still expresses the festival of Easter in the Christian church. In token of devotional feelings towards the sun, they solemnised a festival to that luminary on the day of December in which the days began to lengthen, a log of wood being burnt on the occasion as an emblem of returning light and heat. From this ancient practice, therefore, may be traced the custom of burning the Yule log at Christmas, which is still continued in many parts of England. Among the Anglo-Saxon superstitions was included a belief in giants, dwarfs, and elves, all of a spiritual order, but partaking in some degree of human attributes and feelings. In the term *elfi* or *elves*, we have one of the earliest traces on record of those ideal fairy tribes who afterwards figured in the familiar superstitions of the British islands. The Gothic nations, of whom the Anglo-Saxons were a branch, had various orders of elves, who were understood to haunt the fields, the woods, mountains, and waters, and received denominations accordingly, as field-elfin, dun-elfin, &c. Whether this varied race of spirits originated in the east, whence so many superstitions spread into ancient Europe, is not satisfactorily known, although it is probable that they did, and were of the same genus as the peri of the Persians, a being not dissimilar in character to our fay or fairy. Both in the Scandinavian and Anglo-Saxon superstitions, elves formed an important order of beings, not unlike in character to the demigods, naïads, driads, and other imaginary spirits of the Greek and Roman mythologies, and like them exerted a certain influence over human affairs.

Besides a belief in these mysterious elfin tribes, the Anglo-Saxons brought with them to England the still darker and more dangerous doctrines of witchcraft and divination, before which the reasoning powers of the people quailed, and all intellectual advancement was impeded. The general introduction of Christianity about the year 600, abolished, as a matter of course, the more gross pagan observances, but failed to extirpate the familiar and less obvious superstitions of the people. Witchcraft, wizardry, magic, divination, preparations of charms, and other mystic follies having no foundation in truth, continued to flourish, although opposed both by the more intelligent clergy and the kings. It is from the statutes, indeed, which Alfred, Canute, and other monarchs, passed for the prevention of magical practices, that we chiefly know their nature and extent. *Wiglaer*, a wizard, and *wicca*, a witch, are persons severely denounced. Penalties are enjoined if any one should destroy another by *wiccecraeft*. They appear to have used philtres, for it is declared a crime in any one to use witchcraft, or potions to produce another's love. Canute enjoins his people not to worship fire or floods, wells or stones, or any sort of tree; not to frame death-spells, either by lot or otherwise; and not to effect any thing by phantoms. Wizards, we also learn, pretended to the power of letting loose tempests, and controlling the visible operations of nature.

The introduction of Christianity, as has been mentioned, failed to dissipate the familiar superstitions of the English; a circumstance which can excite no surprise, as no pains were taken to enlighten the understandings of the people, or make them acquainted with the true causes of natural phenomena. We accordingly find, that from the seventh to the sixteenth century, the belief in demons, spirits, lubber fiends, and elves, of every shade and character, prevailed without intermission, and with no further challenge from the clergy than as being individually manifestations of the devil, on whom now the whole load of superstition was based. One goblin, in particular, formed the theme of innumerable legends. What was his name originally in continental Europe, whence he emigrated with the Anglo-Saxons, is of little consequence; in England he became known by the title of Father Rush, from a belief that he had on one occasion personated a monk or friar, and, to serve his own malignant purposes, had in that capacity long imposed on a religious brotherhood; afterwards, this appellation went out of repute, and he was popularly known and feared by the familiar name of Robin Goodfellow, and performed many useful services in the rural districts of England. It is not a little strange that both monks and clergy sanctioned these fancies, and increased their number by the propagation of legends, which we venture to say could not now receive the approbation of a single individual, lay or clerical, in England. Of these it is only necessary to mention the absurd stories which were fabricated and circulated respecting Dunstan, Abbot of Glastonbury, and afterwards Archbishop of Canterbury, who died in the year 988. When a boy, he is stated to have studied theology so sedulously as to reduce him to the point of death, when he was suddenly restored by some divine medicine sent to him by an angel in a storm. So extraordinary a circumstance could not but demand grateful thanksgivings, and Dunstan started from his bed and ran with full speed towards the church. Satan met him in the way, surrounded with numerous black dogs, and endeavoured to defeat his pious intention. But Dunstan was not to be overcome; he instantly prayed for ability, and was enabled to cudgel the devil and his black dogs so effectually, that they left him and the angel together; the latter of whom, finding the church door fastened, took up the pious youth in his arms, and conveyed him to his devotions through the roof. Another time the devil attempted to intrude himself upon St Dunstan's studies in his laboratory, but the saint speedily punished his impertinence, by taking from the fire his tongs, which were red hot, and with them seized the nose of the fiend, who was thereupon glad to make his escape. It is lamentable to think how such vain imaginations should have so long weighed upon the

understandings of the people, and engrafted a habitual dread of the supernatural, which till this day exerts an influence over the untutored mind.

FAIRIES.

Among the various supernatural beings to whom the ignorance and credulity of mankind have given an imaginary existence, the Fairies occupy a prominent place, and are especially worthy of notice. The characters of different classes of spirits have become so mingled and confounded together in the lapse of time, that it is difficult to define individual species with correctness and precision; but there is one characteristic which appears to distinguish the fairy from every other being of a similar order. Most spirits could contract and diminish their bulk at will, but the fairy alone seems to have been regarded as essentially small in size. The majority of other spirits, also, such as dwarfs, brownies, and the like, are represented as deformed creatures, whereas the fairy has almost uniformly been described as a beautiful miniature of the human being, perfect in face and form. These points of distinction, with a dress of pure green, are the principal ones which mark the personal individuality of the fairies as a supernatural race.

The origin of the fairy superstition is ascribed by most writers to the Celtic people, but the blending of the Gothic tribes with the Celts led to the admixture of many attributes of the northern spirits with those proper to the fairies. Thus, the latter race, which appears to have been intrinsically good and benevolent, has been gifted with attributes of the very opposite kind, borrowed from the trolls and elves of the north. In Scotland, and other countries where the Celtic traditions predominated, the fairies retained, in part, the original and better features of their character, and were usually called the Good Neighbours, or the Men of Peace; but even there, their character was deteriorated by a considerable leaven of elfin or dwarfish malignancy. This evil part of their nature caused much annoyance to mankind, and, more especially, their propensity to the kidnapping of human beings. Unchristened infants were chiefly liable to this calamity, but sometimes adult men and women were also carried off. The reason for these abductions is to be found, according to the authorities on this subject, in the necessity which the fairies lay under of paying "kane," as it was called, to the master-fiend, or, in other words, of yielding up one of their number septennially into his hands by way of tribute. They greatly preferred on such occasions to make a scape-goat of some member of the human family. They also carried off young married women to be nurses to their infants; and in Ireland, at this day, when a young woman falls victim to puerperal disease, the country people firmly assert that she has been removed for this purpose.

The necessity for the latter kind of kidnapping shows the fairies to have been *family* people. They are always represented as living, like mankind, in large societies, and under a monarchical form of government. The Salique law seems to have had no countenance among them, for we more often hear of fairy queens than of fairy kings, though both are frequently spoken of. The Land of Faerie was situated somewhere under ground, and there the royal fairies held their court. In their palaces all was beauty and splendour. Their pageants and processions were far more magnificent than any that eastern sovereigns could get up, or poets devise. They rode upon milk-white steeds. Their dresses, of brilliant green, were rich beyond conception; and when they mingled in the dance, or moved in procession among the shady groves, or over the verdant lawns of earth, they were entertained with delicious music, such as mortal lips or hands never could emit or produce. At the same time, most of the legendary tales on the subject represent these splendours as shadowy and unsubstantial. When the eye of a seer, or any one *gifted* with supernatural powers, was turned upon the *fairy* pageantries or banquets, the illusion vanished. Their seeming treasures of gold and sil slate-stones, their stately halls became da and they themselves, from being miniatu human beauty, became personifications ugliness. In short, the Fairy Eden was thing of show without substance.

This is the general account given of the but few of the legends on the subject agree From a very early period, however, every f concurred in giving to the king and queen the names of Oberon and Titania. Oberon rich or Rich Elf of the Germans, and was en his modern name, as well as with new att the old French romancers, who represents tiny creature of surpassing loveliness, with jewels on his head, and a horn in his hand who heard it to the dancing.

It was the belief that unchristened chil peculiarly liable to be carried off by the fa sometimes left little changelings, of their ow place of the infants of mortal kind. Ben his Sad Shepherd, makes the tending and t human changelings to be one of the favourit ployments.

> "There, in the stocks of trees, white fays do d
> And span-long elves, that dance about a pot
> With each a little changeling in their arms."

Various charms were used in Scotland for th tion of stolen children. The most efficacious lieved to be the *roasting* of the supposititious c live embers, when it was understood that the fa would disappear, and the true one be left in It is to be hoped, that this cruel and monstr tice was seldom followed. The possession of called *toadstones* was also held to be an efficac vative against the abduction of children by th In Waldron's Account of the Isle of Man, va rious stories of children kidnapped by the fai one case, where a woman had given birth t her attendants were enticed from the house of "Fire!" and while they were out, the t taken from the helpless mother by an invisib but the sudden re-entry of some of the gossips s the fairies to drop the child, and it was found ing on the threshold. The fairies, who seemed taken a particular liking to this woman's offspri to carry off her second child in the same way, b again. On a third trial, they succeeded, and le them a changeling, a withered and deformed c which neither spoke nor walked during an e of nine years, and ate nothing but a few herb to be feared that this changeling superstition m been the cause of much deplorable cruelty. T member of a family, who from natural misfort defects required the kindliest tending, would often be neglected and wretchedly misused, on of its being an alien. We may smile at ma credulous fancies respecting the fairies, but in this order of superstitions, as in almost a some points which strongly exhibit to us th effects inevitably attendant upon ignorance kind.

Numberless stories of a ridiculous kind hav relative to the intercourse of the fairies with Some of the poor creatures arraigned in s past times for witchcraft, admitted having spondence with the fairies. There can be that these wretched beings, whom the *for* into the confession of *some* kind or other of su traffic, were induced to admit an association in the hope that this would be looked upon a than a league with the enemy of mankind. of Bessie Dunlop and Alison Pearson, in the and 1588, illustrate this statement. Be avowed that her familiar was one Thom ghost of a soldier slain at Pinkie in 1547, a his death seems to have become an inmate She related that this Thome Reid, who a

quently to her in the likeness of an elderly man, grey-coated and grey-bearded, wished her to go with him to the fairy country, and gave her herbs to cure various diseases. He even once brought to her the queen of the fairies, who, to the confusion of poetry, was a fat woman, fond of ale, and, in short, most unlike the Titania of romance. Alison Pearson also admitted her familiarity with the fairies, from whom she frequently received herbs for the cure of disease. It is remarkable that Patrick Adamson, an able scholar and divine, who was created Archbishop of St Andrews by James VI., actually took the medicines prescribed by this poor woman, in the hope that they would transfer an illness with which he was seized to the body of one of his horses. This feat, it was believed, was accomplished by the prescription. The unfortunate women who confessed these things, were deceived in the expectation which led to the act. They could not so save themselves. They were both convicted, and perished at the stake.

It may not be improper in this place to allude to the fancies of the poets on the subject of the fairies. Shakspeare stands pre-eminent in this department. His Midsummer Night's Dream is a poem of exquisite beauty, and one corresponding in every respect with the delicately fanciful nature of the subject. In Romeo and Juliet, he has also described an important fairy, Queen Mab, who has almost dethroned Titania of late years. Mr Tennant's Anster Fair has been of great avail to the fame of Mab. Whoever chooses to consult Drayton and the poets mentioned, will have the pleasure of observing and enjoying the exercise of poetical fancy of the highest order on the subject of fairies.

The superstitions now described are not yet extinct in the British Islands. In Ireland, the Scottish Highlands, and Wales, in particular, the fairies are yet objects of general belief. Education has not yet shed its enlightening influence there, and by education alone can the darkness of superstition be dispelled. This is almost a truism, for superstition and ignorance are nothing else than equivalent terms. The spirit is abroad, however, which will extinguish this remnant of barbarism, and it is consoling to think so, for the ills which have flowed from this source are numberless.

WITCHCRAFT.

A belief that certain individuals possessed magical powers, and could exercise a supernatural influence over their fellow-creatures, existed in ancient Rome, and those who practised, or rather *pretended* to exercise, such arts, were punishable by the civil magistrate. It is to be observed, that neither among the Romans nor the Pagan nations of northern Europe, was witchcraft deemed an offence against *religion;* in some instances, indeed, the witch was supposed to derive her powers from spirits friendly to mankind, and her profession, though feared, was held in honour by her infatuated dupes. Upon the introduction of Christianity, witchcraft assumed a new form, though retaining all its old attributes. Instead of ascribing the supernatural powers of the practitioner to the gods, to Odin, to spirits of good or evil qualities, or to supposed mysteries in nature, the people imputed them to the great fallen spirit mentioned in Scripture. This potent being, from a wicked desire to destroy all that was good and hopeful in man's destiny, was believed to enter into a compact with the aspirant witch, in which, for an irrevocable assignment of her soul at death, he was to grant all her wishes, and assist in all her malevolent projects. These new features in witchcraft, as we shall speedily perceive, thoroughly changed and prodigiously extended the superstition throughout Europe. From being rather a sportive kind of jugglery, or trick in practical magic, and at most only a civil offence, it was recognised as a crime of the deepest dye, meriting the most severe chastisement which the ecclesiastical and civil power could inflict.

We must here notice, however, that the demon or master-fiend of the witchcraft legends was a very different being from that great fallen spirit, held, in a graver view of things, so deeply to influence the best interests of humanity. As this superstition gained force in the Christian world, which it did by slow and successive steps through the whole of the middle ages, or from the fifth century till about the fifteenth, the devil—for it is impossible to avoid the mention of this emphatic name, disagreeable as it is commonly said to be to ears polite—gradually lost many of the former features of his character; or, rather, a different being was substituted for him, combining the characteristics of the Scandinavian Lokke with those of a Satyr of the heathen mythology—a personage equally wicked and malicious as the sterner spirit of evil, but rendered ludicrous by a propensity for petty trickery, and by such personal endowments as a pair of horns, a cow's tail, and cloven feet. There can be no doubt that the demon of the middle ages borrowed these attributes from his human representatives in the old mysteries and plays, where a laudable endeavour was made to make the evil one as ugly as possible. We are told, it is true, that he could at will assume any specious disguise that suited him, but the eye of the initiated observer could readily detect the "cloven foot"—or, in other words, penetrate his true character. Such as he was, he played an important part in the annals of modern witchcraft, which was supposed to rest entirely on the direct and personal agency of himself and the imps commissioned by him. Nor was this supposition confined to the illiterate, or to persons of peculiarly credulous temperament. Authors, distinguished for sense and talent, record with great seriousness, that the devil once delivered a course of lectures on magic at Salamanca, habited in a professor's gown and wig; and that at another time he took up house in Milan, lived there in great style, and assumed, rather imprudently one would say, the suspicious yet appropriate title of the "Duke of Mammon." Even Luther entertained similar notions about the fiend, and, in fact, thought so meanly of him as to believe that he could come by night and steal nuts, and that he cracked them against the bedposts, for the solacement of his monkey-like appetite.

The powers ascribed to this debased demon were exceedingly great. The general belief was, that through his agency storms at sea and land could at all seasons be raised; that crops could be blighted and cattle injured; that bodily illnesses could be inflicted on any person who was the object of secret malice; that the dead could be raised to life; that witches could ride through the air on broomsticks, and transform themselves into the shapes of cats, hares, or other animals, at pleasure. An old writer, speaking of the powers of witches, says—"1. Some work their bewitchings only by way of invocation or imprecation. They wish it, or will it; and so it falls out. 2. Some, by way of emissary, sending out their imps, or familiars, to crosse the way, justle, affront, flash in the face, barke, howle, bite, scratch, or otherwise infest. 3. Some by inspecting, or looking on, or to glare, or peep at with an envious and evil eye. 4. Some by a hollow muttering or mumbling. 5. Some by breathing and blowing on. 6. Some by cursing and banning. 7. Some by blessing and praising. 8. Some revengefully, by occasion of ill turnes. 9. Some ingratefully, and by occasion of good turnes. 10. Some by leaving something of theirs in your house. 11. Some by getting something of yours into their house. 12. Some have a more speciall way of working by severall elements—earth, water, ayre, or fire. But who can tell all the manner of wayes of a witch's working; that works not only darkly and closely, but variously and versatilly, as God will permit, the devil can suggest, or the malicious hag devise to put in practice?"

In the present age of comparative intelligence, it is difficult to understand how human beings could be so deplorably ignorant as to entertain such a gross superstition. We must, however, recollect that the belief was greatly fostered by religious impressions, and that it was long considered a mark of impiety to doubt the existence of witches. Various other circumstances

helped to cherish and magnify the error. The true causes of the majority of natural phenomena were unknown. The nature of the atmosphere, and of certain meteoric appearances—of the laws which regulate storms at sea, and tides—of human maladies and their remedies—were enveloped in obscurity. Natural causes being unknown, and the very doctrine of them unacknowledged, the weak and easily terrified mind flew to the conclusion that all evil proceeded from a power malignant to man, and that by certain impious dealings it was possible for man himself to direct that power against his neighbour.

The superstition seems to have approached its height about the end of the fifteenth century. In his bull of 1484, Pope Innocent charged inquisitors and others to discover and destroy all such as were guilty of witchcraft. This commission was put into the hands of a wretch called Sprenger, with directions that it should be put in force to its fullest extent. Immediately there followed a regular form of process and trial for suspected witches, entitled *Malleus Maleficarum*, or a Hammer for Witches, upon which all judges were called scrupulously to act. The edict of 1484 was subsequently enforced by a bull of Alexander VI. in 1494, of Leo X. in 1521, and of Adrian VI. in 1522, each adding strength to its predecessor, and the whole serving to increase the agitation of the public mind upon the subject. The results were dreadful. A panic fear of witchcraft took possession of society. Every one was at the mercy of his neighbour. If any one felt an unaccountable illness, or a peculiar pain in any part of his body, or suffered any misfortune in his family or affairs, or if a storm arose and committed any damage by sea or land, or if any cattle died suddenly, or, in short, if any event, circumstance, or thing occurred out of the ordinary routine of daily experience, the cause of it was witchcraft. To be accused was to be doomed, for it rarely happened that proof was wanting, or that condemnation was not followed by execution. Armed with the Malleus Maleficarum, the judge had no difficulty in finding reasons for sending the most innocent to the stake. If the accused did not at once confess, they were ordered to be shaved and closely examined for the discovery of devil's marks; it being a tenet in the delusion that the devil, on inaugurating any witch, impressed certain marks on her person; and if any strange mark was discovered, there remained no longer any doubt of the party's guilt. Failing this kind of evidence, torture was applied, and this seldom failed to extort the desired confession from the unhappy victim. A large proportion of the accused witches, in order to avoid these preliminary horrors, confessed the crime in any terms which were dictated to them, and were forthwith led to execution. Other witches, as has been said, seemed to confess voluntarily, being probably either insane persons, or feeble-minded beings, whose reason had been distorted by brooding over the popular witchcraft code. A few extracts from the work of Dr Hutchinson will show the extent of these proceedings:—

"A. D. 1485.—Cumanas, an inquisitor, burnt forty-one poor women for witches, in the county of Burlia, in one year. He caused them to be shaven first, that they may be searched for marks. He continued the prosecutions in the year following, and many fled out of the country.

About this time, Alciat, a famous lawyer, in his *Parergu*, says, 'One inquisitor burnt a hundred in Piedmont, and proceeded daily to burn more, till the people rose against the inquisitor, and chased him out of the country.'

A.D. 1488.—A violent tempest of thunder and lightning in Constance destroyed the corn for four leagues round. The people accused one Anne Mindelin, and one Agnes, for being the cause of it. They confessed, and were burnt.

About this time, H. Institor says, one of the inquisitors came to a certain town, that was almost desolate with plague and famine. The report went, that a certain woman, buried not long before, was eating up her winding-sheet, and that the plague would not cease till she had made an end of it. This matter being taken into consideration, Scultetus, with the chief magistrate of the city, opened the grave, and found that she had indeed swallowed and devoured one-half of her winding-sheet. Scultetus, moved with horror at the thing, drew out his sword, and cut off her head, and threw it into a ditch, and immediately the plague ceased! and the inquisition sitting upon the case, it was found that she had long been a reputed witch.

A.D. 1524.—About this time a thousand were burnt in one year, in the diocese of Como, and a hundred per annum for several years together."

From other authorities it is learned that the devastation was as great in Spain, France, and northern Germany, as it was in the Italian states. About the year 1515, five hundred witches were burned in Geneva in three months, and in France many thousands. An able writer in the Foreign Quarterly Review,* sums up the following particulars respecting the executions for witchcraft in some of the German states:—

"In Germany, to which indeed the bull of Innocent bore particular reference, this plague raged to a degree almost inconceivable. Bainberg, Paderborn, Wurtzburg, and Treves, were its chief seats, though for a century and a half after the introduction of the trials under the commission, no quarter of that great empire was free from its baneful influence. A catalogue of the executions at Wurtzburg for the period from 1627 to February 1629, about two years and two months, is printed by Hauber in the conclusion of his third volume of the Acta et Scripta Magica. It is regularly divided into twenty-nine burnings, and contains the names of 157 persons, Hauber stating at the same time that the catalogue is not complete. It is impossible to peruse the list without shuddering with horror. The greater part of this catalogue consists of old women or foreign travellers, seized, as it would appear, as foreigners were at Paris during the days of Marat and Robespierre. It contains children of twelve, eleven, ten, and nine years of age; fourteen vicars of the cathedral; two boys of noble families, the two little sons of the senator Stolzenburg; a stranger boy; a blind girl; Gobel Babelin, the handsomest girl in Wurtzburg, &c. And yet, frightful as this list of 157 persons executed in two years appears, the number is not (taking the population of Wurtzburg into view) so great as the Lindheim process from 1660 to 1664; for in that small district, consisting at the very utmost of 600 inhabitants, thirty persons were condemned and put to death, making a twentieth part of the whole population consumed in four years.

How dreadful are the results to which these data lead! If we take 157 as a fair average of the executions at Wurtzburg (and the catalogue itself states that the list was by no means complete), the amount of executions there in the course of the century preceding 1628, would be 15,700. We know that from 1614 to 1660 was the great epoch of the witch trials, and that so late as 1749, Maria Renata was executed at Wurtzburg for witchcraft; and though in the interval between 1660 and that date, it is to be hoped that the number of these horrors had diminished, there can be little doubt that several thousands fall to be added to the amount already stated. If Bainberg, Paderborn, Treves, and the other Catholic bishoprics, whose zeal was not less ardent, furnished an equal contingent, and if the Protestants, as we know, actually vied with them in the extent to which these cruelties were carried, the number of victims from the date of Innocent's bull to the final extinction of these prosecutions, must considerably exceed 100,000 in Germany."

WITCHCRAFT IN SCOTLAND.

The mania respecting witchcraft, which sprang up into vigour throughout southern Europe in consequence

* No. XL., 1830.

of the edicts of Innocent and Leo, spread in time to Scotland, and acquired strong possession of the public mind during the reign of Queen Mary. At that period, an act was passed by the Scottish Parliament for the suppression and punishment of witchcraft; but this only served, as the papal bulls had done, to confirm the people in their maniacal credulity, and to countenance and propagate the general delusion. In terms of these ill-judged statutes, great numbers of persons, male as well as female, were charged with having intercourse with the devil, convicted, and burned on the Castlehill of Edinburgh and elsewhere. This continued during the earlier part of the reign of James VI., whose mind, unfortunately for the more aged of the female part of his subjects, was deeply impressed with the flagrant nature of the crime of witchcraft. In 1590, James, it is well known, made a voyage to Denmark to see, marry, and conduct home in person, his appointed bride, the Princess Anne. Soon after his arrival, a tremendous witch conspiracy against the happy conclusion of his homeward voyage was discovered, in which the principal agents appeared to be persons considerably above the vulgar. One was Mrs Agnes Sampson, commonly called the *Wise Wife of Keith* (Keith being a village in East-Lothian), who is described as "grave, matron-like, and settled in her answers." On this occasion, the king was induced by his peculiar tastes to engage personally in the business of judicial investigation. He had all the accused persons brought before himself for examination, and even superintended the tortures applied to them to induce confession. The statements made by these poor wretches form a singular tissue of the ludicrous and horrible in intimate union.

"The said Agnis Sampson was after brought again before the king's majestie and his council, and being examined of the meetings and detestable dealings of these witches, she confessed, that upon the night of All-Hallow-even she was accompanied, as well with the persons aforesaid, as also with a great many other witches, to the number of two hundred, and that all they together went to sea, each one in a riddle, or sieve, and went in the same very substantially, with flaggons of wine, making merrie and drinking by the way in the same riddles, or sieves, to the Kirk of North-Berwick, in Lothian, and that after they had landed, took hands on the land, and danced this reil, or short daunce, singing all with one voice,

'Cummer, goe ye before, cummer, goe ye;
Gif ye will not goe before, cummer, let me.'

At which she confessed that Geillis Duncan did goe before them, playing this reil or daunce upon a small trump, called a Jew's harp, until they entered into the Kirk of North-Berwick. These made the king in a wonderful admiration, and he sent for the said Geillis Duncan, who upon the like trump did play the said daunce before the king's majestie, who, in respect of the strangeness of these matters, took great delight to be present at their examinations."

In the sequel of Agnes Sampson's confession we find some special reasons for the king's passionate liking for these exhibitions, in addition to the mere love of the marvellous. The witches pandered to his vanity on all occasions, probably in the vain hope of mitigating their own doom. Agnes Sampson declared that one great object with Satan and his agents was to destroy the king; that they had held the great North Berwick convention for no other end; and that they had endeavoured to effect their aim on many occasions, and particularly by raising a storm at sea when James came across from Denmark. "The witches demanded of the divell why he did beare such hatred to the king? who answered, by reason the king is the greatest enemie hee hath in the world." Such an eulogy, from such a quarter, could not but pamper the conceit of "the Scottish Solomon."

The following further points in the deposition of Agnes Sampson are worthy of notice. "*Item*, She went with the witch of Carrieburn, and other witches, to the Kirk of Newton, and taking up dead folks and jointing them [cutting off fingers, &c.], made enchanted powders for witchcraft. *Item*, She went with other witches in a boat, the devil going before them like a rock of hay. *Item*, The devil, in the shape of a dog, gave her responses concerning her laird's recovery, and endeavoured to put awa ane of the ladies' daughters. *Item*, she raised a universal great storm in the sea when the queen was coming to Scotland, and *wrote a letter* to that effect to a witch in Leith. *Item*, She used this prayer in the healing of sickness:—

All kinds of ill that ever may be," &c.

The repetition of these and such like verses by the confessing witches, has been matter of frequent surprise. But it must be remembered that a code of witchcraft, extensively known and accredited, existed at that day, regular forms and rules for its exercise having been laid down in the course of time. It must be recollected, also, that these poor creatures, though guiltless of all supernatural intercourse, had really pretended to the gift of healing by charms and incantations in many cases, and had to invent or learn formulas for the purpose. Besides, we find these doggrel scraps chiefly in the revelations of Agnes Sampson. She, it is stated, could write, and of course could read also; and hence she is to be regarded as a person who had had superior opportunities for acquiring a knowledge of the witchcraft code, as well as superior capabilities for filling up deficiencies on the spur of the moment. In her confession she implicated one Doctor Fian, otherwise called John Cunningham, master of the school at Saltpans, in Lothian, a man whose story may be noticed at some length, as one of the most curious and instructive in the whole annals of Scottish witchcraft.

Mrs Sampson deposed that Dr Fian was always a prominent person at the witch-meetings, and Geillis Duncan, the marvellous trump-player, confirmed this assertion. Whether made through heedlessness or malice, these averments decided Fian's fate. He was seized, and after being "used with the *accustomed paine* provided for those offences inflicted upon the rest, first, by *thrawing of his head with a rope*, whereat he would confess nothing;" and, secondly, being urged "by fair meanes to confesse his follies," which had as little effect; "lastly, hee was put to the most severe and cruell paine in the world, called the bootes, when, after he had received three strokes, being inquired if he would confesse his actes and wicked life, his tongue would not serve him to speake; in respect whereof, the rest of the witches willed to search his tongue, under which was founde two pinnes thrust up into the heade, whereupon the witches did say, now is the charme stinted, and showed that those charmed pins were the cause he could not confesse any thing; then was he immediately released of the bootes, brought before the king, and his confession was taken." Appalled by the cruel tortures he had undergone, Fian seems now only to have thought how he could best get up a story that should bring him to a speedy death. He admitted himself to be the devil's "register," or clerk, who took the oaths from all witches at their initiation, and avowed his having bewitched various persons. In proof of the latter statement he instanced the case of a gentleman near Saltpans, whom he had so practised upon, he said, that the victim fell into fits at intervals. This person, who seems to have been either a lunatic or afflicted with St Vitus's dance, was sent for, and "being in his majestie's chamber, suddenly hee gave a great scritch, and fell into madnesse, sometimes bending himself, and sometimes capring so directly up, that his heade did touch the seeling of the chamber, to the great admiration of his majestie." On these and other accounts Dr Fian was sent to prison, but he contrived soon after to escape from it. "By means of a hot and harde pursuite," he was retaken, and brought before the king, to be examined anew. But the unfortunate man had had time to think, and like Cranmer under somewhat similar circumstances, resolved to retract the admis-

sions which the weakness of the body had drawn from him, and to suffer any thing rather than renew them. He boldly told this to the king; and James, whom these records make us regard with equal contempt and indignation, ordered the unfortunate man to be subjected to the following most horrible tortures. "His nailes upon all his fingers were riven and pulled off with an instrument called in Scottish a *turkas*, which in England are called a payre of pincers, and under everie nayle there was thrust in two needles over, even up to the heades; at all which tormentes, notwithstanding, the doctor never shrunk a whit, neither would he then confesse it the sooner for all the tortures inflicted on him. Then was hee, with all convenient speed, by commandement, convaied again to the torment of the bootes, wherein he continued a long time, and did abide so many blowes in them, that his legges were crusht and beaten together as small as might bee, whereby they were make unserviceable for ever." Notwithstanding all this, such was the strength of mind of the victim, or, as King James termed it, "so deeply had the devil entered into his heart," that he still denied all, and resolutely declared that "all he had done and said before was only done and said for fear of the paynes which he had endured." As, according to this fashion of justice, to confess or not to confess was quite the same thing, the poor schoolmaster of Saltpans was soon afterwards strangled, and then burned on the Castlehill of Edinburgh (January 1591).

Much about the same time that Agnes Sampson made her confessions, some cases occurred, showing that witchcraft was an art not confined to the vulgar. A woman of high rank and family, Catherine Ross, Lady Fowlis, was indicted at the instance of the king's advocate for the practice of witchcraft. On inquiry it was clearly proved that this lady had endeavoured, by the aid of witchcraft and poisons, to take away the lives of three or more persons who stood between her and an object she had at heart. She was desirous to make young Lady Fowlis possessor of the property of Fowlis, and to marry her to the Laird of Balnagown. Before this could be effected, Lady Fowlis had to cut off her sons-in-law, Robert and Hector Munro, and the young wife of Balnagown, besides several others. Having consulted with witches, Lady Fowlis began her work by getting pictures of the intended victims made in clay, which she hung up, and shot at with arrows shod with flints of a particular kind, called elf-arrow heads. No effect being thus produced, this really abandoned woman took to poisoning ale and dishes, none of which cut off the proper persons, though others who accidentally tasted them lost their lives. By the confession of some of the assistant hags, the purposes of Lady Fowlis were discovered, and she was brought to trial; but a local or provincial jury of dependants acquitted her. One of her purposed victims, Hector Munro, was then tried in turn for conspiring with witches against the life of his brother George. It was proved that a curious ceremony had been practised to effect this end. Hector, being sick, was carried abroad in blankets, and laid in an open grave, on which his foster-mother ran the breadth of nine riggs, and, returning, was asked by the chief attendant witch, "which she chose should live, Hector or George?" She answered, "Hector." George Munro did die soon afterwards, and Hector recovered. The latter was also acquitted, by a provincial jury, on his trial.

These disgraceful proceedings were not without their parallel in other families of note of the day. Euphemia Macalzean, daughter of an eminent judge, Lord Cliftonhall, was burned at the stake in 1591, having been convicted, if not of witchcraft, at least of a long career of intercourse with pretenders to witchcraft, whom she employed to remove obnoxious persons out of her way — tasks which they accomplished by the very simple means of poisoning, where they did accomplish them at all. The jury found this violent and abandoned woman, for such she certainly was, guilty of participation in the murder of her own god-father, of her husband's nephew, and another individual. They also found her having been at the Wise Woman of Keith's gr convention of North Berwick; but every wi day was compelled to admit having been the compliment to the king, to whom it was a agreeable terror to think himself of so much in as to call for a solemn convocation of the pow to overthrow him. Euphemia Macalzean was assis, *quick*, to the death." This was a doom signed to the less guilty. Alluding to cases of t class, a writer (already quoted) in the Foreign Review remarks, "In the trials of Bessie Roy, Reid, of Patrick Currie, of Isobel Grierson, Grizel Gardiner, the charges are principally off and laying on diseases either on men o meetings with the devil in various shapes and raising and dismembering dead bodies for the of enchantments; destroying crops; scaring hon sons in the shape of cats; taking away women committing housebreaking and theft by means chantments, and so on. South-running wate rowan-tree, enchanted flints (probably elf-arrow and doggrel verses, generally a translation of th or Lord's Prayer, were the means employed fo ing a cure." Diseases, again, were laid on by pictures of clay or wax; by placing a dead h some mutilated member, in the house of the v victim; or by throwing enchanted articles at h A good purpose did not save the witch; into with spirits, in any shape, being the crime.

Of course, in the revelations of the various inconsistencies were abundant, and even plain dent impossibilities were frequently among the averred. The sapient James, however, in being led by these things to doubt the whole, strengthened in his opinions, it being a maxim that the witches were "all extreme lyars." Oth sons came to different conclusions from the sa mises, and before the close of James's reign, ma of sense began to weary of the torturings and mations that took place almost *every day*, in t country, and had done so for a period of thirt (betwixt 1590 and 1620). Advocates now ca ward to defend the accused, and in their pl ventured even to arraign some of the received of "Daemonologie" laid down by the king himse book bearing that name. The removal of Ja England moderated, but did not altogether st witch prosecutions. After his death they sla more considerably. Only eight witchcraft cases the Record as having occurred between 1625 an in Scotland, and in one of these cases, remark tell, the accused escaped. The mania, as it a was beginning to wear itself out.

As the spirit of puritanism gained strength, h which it gradually did during the latter part reign of Charles I., the partially cleared horiz came again overcast, and again was this owing judged edicts, which, by indicating the belief great and the educated in witchcraft, had the effect of reviving the frenzy among the flexible lace. The General Assembly was the body in t this occasion, and from this time forward the were the great witch-hunters in Scotland. T sembly passed condemnatory acts in 1640, 43, and 49, and with every successive act the ca convictions increased, with even a deeper de attendant horrors than at any previous time. old impossible and abominable fancies," says the formerly quoted, "of the *Malleus* were revived. thirty trials appear on the Record between 16 the Restoration, only one of which appears to h minated in an acquittal; while at a single circu at Glasgow, Stirling, and Ayr, in 1659, sevente sons were convicted and burnt for this crime. it must be remembered that the phrase "on the R alludes only to justiciary trials, which formed small proportion of the cases really tried. Th ciary lists take no note of the commissions per

ren by the privy-council to resident gentlemen and rgymen to try and burn witches in their respective tricts. These commissions executed people over e whole country in multitudes. Wodrow, Lamont, rcer, and Whitelocke, prove this but too satisfac-rily.

The clergy continued, after the Restoration, to pur-e these imaginary criminals with a zeal altogether plorable. The Justiciary Court condemned twenty rsons in the first year of Charles II's reign (1661), d in one day of the same year the council issued rteen new provincial commissions, the aggregate ings of which one shudders to guess at. To compute air condemnations would be impossible, for victim er victim perished at the stake, unnamed and un-ard of. Morayshire became at this particular period scene of a violent fit of the great moral frenzy, and e of the most remarkable examinations signalising whole course of Scottish witchcraft took place in county. The details, though occasionally ludicrous n their absurdity, are too horrible for narration in present pages.

The popular frenzy seems to have exhausted itself its own virulence in 1661–62, for an interval of six rs subsequently elapsed without a single justiciary l for the crime of witchcraft, and one fellow was ually whipped for charging some person with it. er this period, the dying embers of the delusion only st out on occasions, here and there, into a momen-y flame. In 1678, several women were condemned, n their own confession," says the Register; but we spect this only means, in reality, that one malicious ing made voluntary admissions involving others, as st often have been the case, we fear, in these pro-edings. Scattered cases took place near the beginning the eighteenth century, such as those at Paisley in 7, at Pittenweem in 1704, and at Spott about the e time. It is curious, that, as something like di-t evidence became necessary for condemnation, that idence presented itself, and in the shape of possessed enchanted young persons, who were brought into urt to play off their tricks. The most striking case this nature was that of Christian Shaw, a girl about ven years old, and the daughter of Mr Shaw of Bar-rran, in Renfrewshire. This wretched girl, who ms to have been an accomplished hypocrite, young she was, quarrelled with a maid-servant, and, to be venged, fell into convulsions, saw spirits, and, in short, gined herself bewitched. To sustain her story, she cused one person after another, till not less than nty were implicated, some of them children of the e of twelve and fourteen! They were tried on the idence of the girl, and five human beings perished ough her malicious impostures. It is remarkable t this very girl afterwards founded the thread manu-ture in Renfrewshire. From a friend who had been Holland, she learnt some secrets in spinning, and, utting them skilfully in practice, she led the way to e extensive operations carried on in that department late years. She became the wife of the minister of lmaurs, and, it is to be hoped, had leisure and grace repent of the wicked misapplication, in her youth, those talents which she undoubtedly possessed.

The last justiciary trial for witchcraft in Scotland s in the case of Elspeth Rule, who was convicted in 8, and—banished. The last regular execution for e crime is said to have taken place at Dornoch in 22, when an old woman was condemned by David ss, sheriff of Caithness. But we fear the provincial ecords of the north, if inquired into, would show later aths on this score. However, here may be held to d the tragical part of the annals of Scottish witchcraft. e number of its victims, for reasons previously ated, it would be difficult accurately to compute, but e black scroll would include, according to those who ve most attentively inquired into the subject, upwards FOUR THOUSAND persons! And by what a fate they erished! Cruelly tortured while living, and dismissed om life by a living death amid the flames! And for what! For an impossible crime! And who were the victims, and who the executioners? The victims, in by far the majority of cases, were the aged, the weak, the deformed, the lame, and the blind; those to whom nature had been ungentle in her outward gifts, or whom years and infirmities had doomed to poverty and wretch-edness; exactly that class of miserable beings, in short, for whom more enlightened times provide houses of refuge, and endow charitable institutions, aiming, in the spirit of true benevolence, to supply to them that attention and support which nature or circumstances have denied them the power of procuring for them-selves. Often, too, was the victim a person distin-guished by particular gifts and endowments; gifts bestowed by the Creator in kindness, but rendered fatal to the possessor by man. These were the victims of witchcraft. The executioners were the wisest and greatest of their time. Men distinguished above their fellows for knowledge and intelligence, ministers of religion and of the laws, kings, princes, and nobles—these, and such as these, judged of the crime, pro-nounced the doom, and sent the poor victims of delu-sion to the torture, the stake, and the scaffold.

WITCHCRAFT IN ENGLAND.

Witchcraft was first denounced in England, by formal and explicit statutes, in the year 1541, in the reign of Henry VIII. Previously to that time, many witch-trials had taken place, and severe punishments had even been inflicted on the parties concerned; but this was occasioned by the direction of the arts of sorcery, in these particular instances, against the lives and well-being of others, and not from the legal criminality of such arts themselves. Shakspeare has made some early cases of this nature familiar to us, and in particular that of the Duchess of Gloucester, who, for conspiring with witches against the life of the reigning sovereign, Henry VI., was compelled to do public penance, and imprisoned for life. But, as has been said, the mode of prosecut-ing the guilty purpose was here altogether a subsidiary matter. If a person waved his hat three times in the air, and three times cried "Buzz!" under the impres-sion that by that formula the life of another might be taken away, the old law and law-makers (as, for ex-ample, Selden, who states this very case) considered the formulist worthy of death as a murderer in intent; and upon this principle the trafficking with witches was punished in early times.

Witchcraft, however, by and bye assumed greater statutory importance, in England as elsewhere. Henry VIII.'s two acts were levelled against conjuration, witch-craft, false prophecies, and pulling down of crosses. Here the charge was still something beyond mere sorcery, and it was left for Elizabeth, in 1562, to direct a statute exclusively against that imaginary crime. At the same time, that princess extenuated her conduct in part, by limiting the penalty of the crime, when stripped of its customary accessories, to the pillory. The first trans-gression, at least, received no heavier punishment. The cases of Elizabeth's reign were chiefly cases of pre-tended possession, sometimes, however, involving capital charges against those said to have caused the possession. In one famous case, of which the main features were as ludicrous as the issue was deplorable, three poor persons, an old man named Samuel, with his wife and daughter, were tried at Huntingdon, for having be-witched the children of a Mr Throgmorton. Joan Throgmorton, a girl of fifteen, and the eldest of the children, was the main witness for the prosecution. She related many scenes, in which the actors were her-self and a number of spirits sent by Dame Samuel to torment her, and to throw her into fits. These spirits, she said, were on familiar terms with her, and were named Pluck, Hardname, Catch, Blue, and three Smacks, who were *cousins*. Among other things, she said that one of the Smacks professed himself an ad-mirer of hers, and beat the rest for her sake, as in the following instance related by her. One day Smack appeared before her. "Whence come you, Mr Smack!"

she said to him. "From fighting Pluck and the rest, with cowl-staves, in Dame Samuel's back-yard," replied Smack; and soon thereafter, accordingly, Pluck and Blue walked in, the one with his head broken, and the other limping. "How do you manage to beat them?" said the young lady to the victorious Smack; "you are little, and they are big." "Oh," says Smack, "I can take up any two of them, and my cousins beat the rest." Of such stuff were these charges made. It would appear that they were either the offspring of insanity on the part of the youthful Throgmortons, or that, having begun the farce in sport or spite, the accusers found at length that they could not retreat without a disgraceful confession of imposture. In part, the conduct of the poor Samuels was affecting, and even high-minded. After lengthened worrying, the accusers got Dame Samuel indirectly to confess her guilt, by making her repeat a prescribed charm, which had the effect of at once bringing the children out of their fits. But the old man and the daughter steadily maintained their innocence. The unfortunate family were condemned on the 4th April 1593, and soon after executed.

When James I. ascended the English throne, he unfortunately conceived it to be his duty immediately to illuminate the southerns on the subject of witchcraft. An act of the first year of his reign defines the crime with a degree of minuteness worthy of the adept from whose pen it undoubtedly proceeded. "Any one that shall use, practise, or exercise any invocation of any evil or wicked spirit, or consult or covenant with, entertain or employ, feed or reward, any evil or wicked spirit, *to or for* ANY *purpose*; or take up any dead man, &c. &c. &c.; such offenders, duly and lawfully convicted and attainted, shall suffer death." We have here witchcraft first distinctly made, of itself, a *capital* crime. Many years had not passed away after the passing of this statute, ere the delusion, which had heretofore committed but occasional and local mischief, became an epidemical frenzy, devastating every corner of England. Leaving out of sight single executions, we find such wholesale murders as the following in abundance on the record. In 1612, twelve persons were condemned at once at Lancaster, and many more in 1613, when the whole kingdom rang with the fame of the "Lancashire witches;" in 1622, six at York; in 1634, seventeen in Lancashire; in 1644, sixteen at Yarmouth; in 1645, fifteen at Chelmsford; and in 1645 and 1646, sixty persons perished in Suffolk, and nearly an equal number, at the same time, in Huntingdon. These are but a few selected cases. The poor creatures, who usually composed these ill-fated bands, are thus described by an able observer:—"An old woman with a wrinkled face, a furred brow, a hairy lip, a gobber tooth, a squint eye, a squeaking voice, or a scolding tongue, having a ragged coat on her back, a spindle in her hand, and a dog by her side—a wretched, infirm, and impotent creature, pelted and persecuted by all the neighbourhood, because the farmer's cart had stuck in the gateway, or some idle boy had pretended to spit needles and pins for the sake of a holiday from school or work"—such were the poor unfortunates selected to undergo the last tests and tortures sanctioned by the laws, and which tests were of a nature so severe that no one would have dreamed of inflicting them on the vilest of murderers. They were administered by a class of wretches, who, with one Matthew Hopkins at their head, sprung up in England in the middle of the seventeenth century, and took the professional name of *witch-finders*. The practices of the monster Hopkins, who with his assistants moved from place to place in the regular and authorised pursuit of his trade, will give a full idea of the tests referred to, as well as of the horrible fruits of the witchcraft frenzy in general. From each town which he visited, Hopkins exacted the stated fee of twenty shillings, and, in consideration thereof, he cleared the locality of all suspected persons, bringing them to confession and the stake in the following manner:—He stripped them naked, shaved them, and thrust pins into their bodies to discover the witch's mark; he wrapped t sheets, with the great toes and thumbs tied t and dragged them through ponds or rivers, they sunk, it was held as a sign that the baptis ment did not reject them, and they were clear if they floated (as they usually would do for a they were then set down as guilty, and doom kept them fasting and awake, and sometimes santly walking, for twenty-four or forty-eight h an inducement to confession; and, in short, p on the accused such abominable cruelties, th were glad to escape from life by confession. If could not shed tears at command (said the furth of this wretch's creed), or if she hesitated at a word in repeating the Lord's Prayer, she was in with the evil one. The results of these and sim tests were actually and universally admitted as evi by the administrators of the law, who, acting them, condemned all such as had the amazing cou to hold out against the tortures inflicted. Few g courts that trouble. Butler has described Hopk his Hudibras, as one

> "Fully empower'd to treat about
> Finding revolted witches out.
> And has he not within this year
> Hang'd *three score* of them in *one* shire?
> Some only for *not* being drown'd;
> And some for sitting above ground."

After he had murdered hundreds, and pursued trade for many years (from 1644 downwards), th of popular opinion finally turned against Hopkins, he was subjected, by a party of indignant experimen to his own favourite test of swimming. It is said he escaped with life, but, from that time forth, h never heard of again.

The era of the Long Parliament was that, perh which witnessed the greatest number of executions witchcraft. *Three thousand persons* are said to perished during the continuance of the sittings of body, by legal executions, independently of simil deaths at the hands of the mob. Witch-execut however, were continued with nearly equal freque long afterwards. One noted case occurred in 1 when the enlightened and just Sir Matthew Hale t and condemned two women, Amy Dunny and R Callender, at Saint Edmondsbury, for bewitching dren, and other similar offences. Some of the item the charge may be mentioned. Being capriciously fused some herrings, which they desired to purchase two old women expressed themselves in impatient guage, and a child of the herring-dealer soon afterw fell ill—in consequence. A carter drove his wa against the cottage of Amy Dunny, and drew from some not unnatural objurgations; immediately which, the vehicle of the man stuck fast in a gate, out its wheels being impeded by either of the posts the unfortunate Amy was credited with the acci Such accusations formed the burden of the dittay addition to the bewitching of the children. These y accusers were produced in court, and, on being tou by the old women, fell into fits. But, on their being covered, they were thrown into the same co sions by *other* parties, precisely in the same way. the face of this palpable proof of imposture, and d the general absurdity of the charges, Sir Matthew committed Amy Dunny and Rose Callender t tender mercies of the hangman. It is stated tha opinion of the learned Sir Thomas Browne, wh accidentally present, had great weight against th soners. He declared his belief that the children truly bewitched, and supported the possibility of possessions by long and learned arguments, theol and metaphysical. Yet Sir Matthew Hale was the wisest and best men of his time, and Sir Th Browne had written an able work in exposit Popular Fallacies!

This case occurred in 1664. For some subse years trials and executions were yet far from ra

hief-Justices North and Holt, to their lasting credit, ere the first individuals occupying the high places of e law, who had at once the good sense and the cou-ge to set their faces against the continuance of this estructive delusion. In one case, by detecting a piece f gross imposture, Chief-Justice North threw into dis-pute, once and for all, the trick of *pin-vomiting*, one f the most striking and convincing practices of the ossessed. A male sorcerer stood at the bar, and his pposed victim was in court, vomiting pins in profu-ion. These pins were straight, a circumstance which ade the greater impression, as those commonly ejected such cases were bent, engendering frequently the spicion of their having been previously and purposely eed in the mouth. The chief-justice was led to sus-ect something in this case by certain movements of e bewitched woman, and, by closely cross-questioning e of her own witnesses, he brought it fully out that e woman placed pins in her stomacher, and, by a ecurous dropping of her head in her simulated fits, icked up the articles for each successive ejection. The an was found guiltless. The acquittal called forth ch pointed benedictions on the judge from a very old oman present, that he was induced to ask the cause. Eh, my lord," said she, "twenty years ago they would ve hanged me for a witch if they could, and now, but your lordship, they would have murdered my inno-nt son."

The detected imposture in this case saved the accused. was under Holt's justiceship, however, that the first quittal is supposed to have taken place, in *despite* of evidence, and upon the fair ground of the general surdity of such a charge. In the case of Mother mmings, tried in 1694, the unfortunate pannel would ssuredly have perished, had not Chief-Justice Holt summed up in a tone so decidedly adverse to the pro-ecution, that the verdict of Not Guilty was called forth om the jury. In about ten other trials before Holt, tween the years 1694 and 1701, the result was the me, through the same influences. It must be re-membered, however, that these were merely noted ses, in which the parties withstood all preliminary ducements to confession, and came to the bar with plea of not guilty. About the same period, that is, ring the latter years of the seventeenth century, mmary executions were still common, in consequence confessions extracted after the Hopkins fashion, yet much in favour with the lower classes. The ac-dentals mentioned only prove that the regular mini-ers of the law were growing too enlightened to coun-nance such barbarities. Cases of possession, too, re latterly overlooked by the law, which would have ought the parties concerned to a speedy end in earlier ys, even though they had done no injury to other ople, and were simply unfortunate enough to have ade compacts with the demon for the attainment of me purely personal advantages. For example, in 03, there occurred the famous case of a youth, named mbard Dugdale, who sacrificed himself to the devil, condition of being made the *best dancer* in Lanca-re. The dissenting clergy took this youth under eir charge, and a committee of them fasted and ayed, publicly and almost incessantly, for a whole ar, in order to expel the dancing demon. The idea this impostor leaping for a twelvemonth, and playing ntastic tricks before these grave divines, is extremely licrous. But the divines played tricks not less fan-stic. They became so contemptuously intimate with e demon, as to mock him on account of saltatory de-ficiencies. A portion of their addresses to him on this asion has been preserved, but of too ridiculous a na-re for quotation in these pages. If any thing else an a mere impostor, it is probable that Dugdale was fected with St Vitus's Dance; and this is the more kely, as a regular physician brought his dancing to a se after all. But the divines took care to claim the edit of the cure.

After the time of Holt, the ministers of the law went step farther in their course of improvement, and spared the accused in spite of condemnatory *verdicts*. In 1711, Chief-Justice Powell presided at a trial where an old woman was pronounced guilty. The judge, who had sneered openly at the whole proceedings, asked the jury if they found the woman "guilty upon the indict-ment of conversing with the devil in the shape of a cat?" The reply was, "We do find her guilty of that;" but the question of the judge produced its intended effect in casting ridicule on the whole charge, and the woman was pardoned. An able writer in the Foreign Quarterly Review remarks, after noticing this case, "yet, frightful to think, after all this, in 1716, Mrs Hicks, and her daughter, aged *nine*, were hanged at Huntingdon for selling their souls to the devil, and raising a storm by pulling off their stockings, and mak-ing a lather of soap! With this crowning atrocity, the catalogue of murders in England closes." And a long catalogue, and a black catalogue it was. "Barrington, in his observations on the statute of Henry VI., does not hesitate to estimate the numbers of those put to death in England, on this charge, at THIRTY THOUSAND!"

We have now glanced at the chief features in the history of witchcraft in England, from the enactment of the penal statutes against it. These statutes were not finally abolished till the middle of the eighteenth century, and unhappy consequences followed, in various instances, from their being left unrepealed. Though among the enlightened classes the belief in witchcraft no longer existed, the populace, in town and country, still held by the superstitions of their forefathers, and, having the countenance of the statute-book, persecuted the unfortunate beings whose position and circumstances laid them open to the suspicion of sorcery. The ban of public opinion told severely enough upon the comforts of such poor creatures, but the rabble occasionally carried their cruel and ignorant oppressions to a greater length. On the 30th of July 1751, an aged pauper named Osborne, and his wife, were seized by a mob in Staffordshire, dragged through pools, and otherwise so vilely misused, that the woman died under the hands of her assailants. The attention of the law, and the indignation of the humane, were aroused. One man, who had taken a prominent share in the brutal outrage, was condemned on trial, and executed. Immediately afterwards, the penal statutes against witchcraft were abrogated by the legislature, and the remembrance of them only remains, as a wonder and warning to the posterity of those who practised and suffered from them, as well as to mankind at large.

It must not be imagined, we may observe in conclu-sion, that the present generation has no need of such a warning, or is relieved by its increased enlightenment from all chance of falling into similar errors. The nineteenth century has witnessed such impostors as Johanna Southcote, Matthews, and Thom, and has seen a degree of enthusiastic and unhesitating credence given to their pretensions by many persons moving in a most respectable rank in society, which shows that the cre-dulous spirit that created and supported witchcraft is not by any means extinguished. It is indeed a spirit only to be fully eradicated by such a universality of education and intelligence as can scarcely be expected to exist, excepting after the lapse of long-coming cen-turies of improvement. The subject which has been treated of here, has therefore a moral. In brief words, the world may learn from it the peril of encouraging the idea of the possibility of direct spiritual influences and communications in these latter days—a thing dis-countenanced alike by the lights of reason and scripture.

SPECTRAL ILLUSIONS.

The subject of spectral illusions, or, to use the common phraseology, apparitions or spectres, is now, in the esti-mation of scientific and properly informed men, one of the simplest and most intelligible to which the mind can be directed; while, to the ignorant, it still appears full of doubt and mystery. An apparition, spectre, ghost, or whatever it may be called, is vulgarly supposed to be a supernatural appearance—a thing occurring out of the

in structure by disease. Disease of the brain, which involves organic mental disorder, is properly disease of the body, but enduring lunacy or fatuity, existing (if they can do so) without disease in the structure of the brain, may also be called organic disorder of the mind. These explanations will show what is meant by that epithet, as applied either to affections of the mind or body. Functional disorder, again, of the mind or body, is that condition of things where the healthy action of the organ or organs, in part or whole, is impeded, without the existence of any disease of structure. It may be said that violent excitement of the imagination or passions constitutes functional mental disorder; "anger is a temporary madness," said the Romans wisely. As for functional bodily disorder, temporary affections of the digestive organs may be pointed to as common cases of such a species of physical derangement. All these disorders, and kinds of disorders, may appear in a complicated form, and, what is of most importance to our present argument, the *nervous system*, on which depends the action of the *senses*, the power of *volition*, and the operation of all the involuntary functions (such as the circulative and digestive functions), is, and must necessarily be, involved more or less deeply in all cases of constitutional disorder, organic or functional. These powers of the nerves, which form the sole medium by which mind and body act and react on each other, give us a clue to the comprehension of those strange phenomena called spectral illusions, which depend on a combination of mental and physical impressions.

Organic mental disorder generates spectral illusions. Almost every lunatic tells you that he sees them, and with truth; they are seemingly present to his diseased perceptions. The same cause, simple insanity, partial or otherwise, and existing either with or without structural brain disease, has been, we truly believe, at the foundation of many more apparition-cases than any other cause. By far the greatest number of such cases ever put on record, have been connected with fanaticism in religious matters; and can there be a doubt that the majority of the poor creatures, men and women, who habitually subjected themselves, in the early centuries

Sometimes they e forms of living friends, and sometimes of people ead. Dr Alderson resorted to a course of treatvhich restored the strength of the digestive orand gradually banished the spectres. At the close account, it is said that the man emphatically sed himself to have now received "a perfect tion of the nature of ghosts."

ıy additional cases from Hibbert, Abercromby, her writers, might be quoted, in which the visual sions and perceptions were in a similar way d by the influence of digestive derangement. But loubt can rationally exist on the point, from the rative commonness of the disease, no more proof be brought forward. However, the inference lly deducible from these facts is too important overlooked. Here we find, by unquestionable l evidence, that a man walking about in apparent health, and mentally sane, may nevertheless be t to most distinct visitations of spectral figures, f them in the semblance of *dead* persons. We is, we repeat, to be within the range of natural mena. Now, is it not more likely, in those cases wonderful apparitions are reported to have been that the whole was referable to such natural , than that the grave gave up its dead, or that s of the universe were specially broken in upon other way! Even with only one such admitted of spectral illusions as the malady alluded to, ould certainly err in passing it by to seek for ations in supernatural quarters. But in reality ve *many* causes or sources of them, and to these all now look, in continuation of our argument.

ong the other varieties of bodily ailments affecting structure or function, which have been found to e spectral illusions, fevers, inflammatory affecepileptic attacks, hysteria, and disorders of the generally, are the most prominent. As refevers and inflammatory affections, particularly of the brain, it is well known to almost every r or member of a large family, that scarcely any case can occur without illusions of the sight to a r or less extent. In hysteric and epileptic cases, here fits or partial trances occur, the same phea are frequently observed. But we shall not en- the effects produced by the influence of severe viously existing maladies, as it is in those cases here the spectre-seer has exhibited *apparent* of mind and body, that special wonder has been . It is so far of great importance, however, to that these diseases do produce the illusions, as t cases it will be found on inquiry that the party t to them, however sound to appearance at the *fterwards* displayed some of these complaints in ree; and we may then rationally explain the matter by supposing the seeds of the ailments to arly existed in a latent state. A German lady, of nt talents and high character, published an acome years back of successive visions with which d been honoured, as she believed, by Divine fa-

Dr Crichton, however, author of an able work anity, found that the lady was always affected he *aura epileptica* during the prevalence of the ns; or, in other words, that she was labouring slight attacks of epilepsy. Thus simply was exd a series of phenomena which, from the high ter for veracity of the subject of them, astonished t part of Germany. Another case, where funcbodily disorder of a different and very simple was present in an unrecognisable state, and proextraordinary illusions, was the famous one of i, the Berlin bookseller. This individual, when erfectly fit state to attend to his ordinary busiwas suddenly visited one day, when casually excited by some annoying circumstance, by the figure of a person long dead. He asked his wife, who was present, if she saw it; she did not. The bookseller was at first much alarmed, but, being a man of sense and intelligence, he soon became convinced of the illusory yet natural character of the spectra, which subsequently, for a period of two whole years, appeared to him in great numbers, and with daily frequency. "I generally saw (says he) human forms of both sexes, but they took not the smallest notice of each other, moving as in a market-place, where all are eager to press through the crowd; at times, however, they seemed to be transacting business with one another. I also saw several times people on horseback, dogs, and birds. All these phantasms appeared to me in their natural size, and as distinct as if alive; none of the figures appeared particularly terrible, comical, or disgusting, most of them being of an indifferent shape, and some presenting a pleasing aspect. The longer these phantoms continued to visit me, the more frequently did they return." They also spoke to him repeatedly.

These phantasms lasted, as we have said, two years. The issue is peculiarly worthy of note. Nicolai had in former years fallen into the habit of periodical bloodletting by leeches, but had ventured to stop the practice previous to the accession of the phantasms, and during their prevalence he had only been advised to attend to the state of his digestive organs. After they had endured for the time mentioned, it was thought fit to renew the blood-letting. At eleven in the morning, while the room was crowded with the spectral figures, the leeches were applied. As the bleeding slowly proceeded, the figures grew dimmer and dimmer, and finally, by eight o'clock in the evening, they had all melted into thin air, never to re-appear! This most remarkable case, the first in which any individual dared calmly to come forward and avow such an affection, at the risk of incurring the charge of insanity, was founded, we thus see, simply on a plethoric or surcharged state of the blood-vessels. Nicolai deserves great credit for the philosophic composure with which he recorded the phenomena presented to him; but his statement, which has often been republished in this country, seems defective in some points, and, from the interest of the subject, we may be pardoned for presuming to notice these. Generally speaking, he represents his spectral visitants as things which came and went, and assumed various shapes, and appeared in certain numbers, *uninfluenced* directly *by himself*. The total dependence which they had upon his own fancy of the *moment*, is not put clearly before us, though, by the truthful accuracy of his narrative, he unconsciously makes that fact apparent every instant. The surcharged state of the vessels was the fundamental cause of the phantasms, but his own passing fancies moulded them for the passing moment into shape, regulated their numbers, and gave them words. How could it be otherwise? The whole panorama was exhibited on his own retina, and the working brain behind was the manager and scene-shifter of the show.

Second-Sight.—Second-sight, taking the word in its common acceptation of supernatural sight-seeing, is one of the varieties of spectral illusion. Certain mental functions becoming diseased, the sense of sight is imposed upon by the appearance of things which are purely imaginary, but nevertheless supposed to be prophetic of future events. Idleness, solitude, insufficient diet, and an imagination led astray by ruminating too intensely on the causes of human weal and wo, may be assigned as the prevailing causes of the disease. The Lowland Scotch used occasionally to see *wraiths*, or spectral appearances of persons who were soon to quit this mortal scene; the Irish were also accustomed to the spectacle of *fetches;* and the Highlanders had their *second-sight*—the whole, be it observed, being but a variety of the same mental disease and delusion.

Second-sight, however, has formed the subject of a more regular profession than any other species of spectral frenzy. There were persons, who, possessing from infancy a defective mental constitution, or having a

less rules affecting its exercise, and the interpretation of its visions. If a vision occur by day, for example, the accomplishment of what it is supposed to predict will be speedy; if by night, less so. An exact proportion, indeed, is maintained in this respect—the morning vision being sooner fulfilled than that of noon; the latter more quickly than that of the afternoon; and so on. If the seer beholds a figure in a shroud, it is considered a sure sign of death to the party represented by the figure; and, according to the extent to which the shroud covers the body, the end will be quicker or slower. If a woman be seen at a man's left hand, it is a presage that she will be his wife, and this will be the case (say the true believers) though even both should then be married. If more than one woman be seen standing at a man's left hand, they will be married to him in rotation, as they stand nearer or farther from his arm. A seer often announces that such and such a guest will arrive at a certain hour, and, though a hundred miles away, the guest, it is said, will appear at the stated time. If a seer observe a vision of trees and crops in some spot or another, though perfectly barren and bare at the moment, wood and grain will, it is believed, there be seen in due time. A visionary house is beheld by the gifted eye, in a place where stone and lime were never laid, or expected to be laid. Yet there will the real house forthwith be seen. To see a seat as if vacant when one is sitting in it, is a presage of the party's death. The seer may behold crowds of people, or single individuals, and very frequently he meets imaginary funeral parties, and determines the coming decease by the apparent mourners.

These rules of vaticination are *said to be* unvarying. No ordinary person sees the vision while it is present to the seer, but the same vision often appears to two or more of the gifted, either while they are together or apart. The Highlanders believe that children and the lower animals, such as cows and horses, behold the appearances while they are before the seer. This is made plain, they say, in the case of the animals, by the trembling which seizes them at the moment; and frequently the children will cry, and, if asked the reason, will tell what unusual thing they behold or have beheld. It is almost needless to say, that the stories told to prove the truth of these notions, rest on no sure foundation,

d, a hand and an arm, when the stroke was given, heard.' The devil said to him, 'Saw you that? It not my hand, it was my father's; my hand is more in the loof (palm). Would you see me,' says the thief, 'put out the candle, and I shall come butt house (into the outer room) among you like fire-,'" &c. The visit of the minister was unavailing. out this time the devil began with new assaults; taking the ready meat which was in the house, did times hide it in holes by the door-posts, and at r times hid it under the beds, and sometimes g the bed-clothes and under the linens, and at did carry it quite away, till nothing was left there bread and water. The goodwife, one morning ing porridge for the children's breakfast, had the ien plate, wherein the meal lay, snatched from her kly. 'Well,' says she, 'let me have my plate again.' reupon it came flying at her, without any skaith ." Any further extract from this ridiculous, though ne time universally believed, narrative, would be cessary. A modern police-officer would have effec- y relieved "the afflicted family," by instantly dis- ring the performer of the tricks, and taking him custody.

sides the belief in aërial and terrestrial spirits, our ulous ancestors put faith in all kinds of romancing es of river and sea demons. The more prevalent ese superstitious notions was a belief in mermaids mermen, a class of creatures who lived in the sea, ad bodies half-human half-fish. Mermaids appear ve been much more common than mermen. The naid, we are told, possessed the body, from the ls upwards, of a beautiful female, with a head flow- ith long yellow hair, which she incessantly combed one hand, while she held a small mirror with the r. This female monster of the deep is described ving been a constant schemer of destruction to ding navigators, or those who haunted unfrequented of the sea-shores.

nother of the vulgar superstitions of our ancestors a belief common to nations of Germanic origin, the corpse of a murdered person would bleed on touched by the person who was guilty of the der. Strange to say, this species of evidence of was at one time admitted in the Scottish criminal ts. The following incredible instance was commu- ed to Sir Walter Scott, and is given in his Min- y of the Scottish Border (vol. ii. p. 54.) "Two g men, going a-fishing in the River Yarrow, fell and so high ran the quarrel, that the one, in a on, stabbed the other to the heart. Astonished at ash act, he hesitated whether to fly, give himself justice, or conceal the crime; and in the end, on the latter expedient, burying the body of his d very deep in the sands. As the meeting had accidental, he was never suspected, although a le change was observed in his behaviour, from y to a settled melancholy. Time passed on for the of fifty years, when a smith, fishing near the same , discovered an uncommon and curious bone, which t in his pocket, and afterwards showed to some e in his smithy. The murderer being present, an old white-headed man, leaning on his staff, de- a sight of the little bone; but how horrible was ene!—no sooner had he touched it, than it streamed purple blood. Being told where it was found, he ssed the crime, was condemned, but was prevented eath from suffering the punishment due to his ." We need only add, that no evidence is given e truth of this improbable tale, and it is utterly rthy of belief.

norance has often been justly termed the mother perstition; wherever mankind are most ignorant, ast accustomed to trace events to their natural roximate causes, there do all kinds of superstitious notions luxuriantly flourish. When the mind allows that matters of ordinary occurrence take place by the interference of invisible agents, such pirits, apparitions, devils, and so forth, there is

spinnage. The infants are on a Monday morning taken to this woman, who, for threepence, cuts through the lobe of the ear with a pair of scissors, then makes a cross with the blood upon the forehead and breast of the child. On the following Monday, the same barbarous ceremony is performed upon the left ear ; and on the succeeding Monday the right ear is again doomed to undergo the same ceremony. In some cases it is deemed necessary to perform the operation nine times."

The occurrence in 1840 of a fatal disease in cattle, called the *murrain*, and which was susceptible of remedy by proper surgical means, led to the exposure of various superstitious observances among a respectable class of the rural population of England. In Northumberland, a fire kindled by rubbing together two pieces of hard wood, was carried about in an old shoe from one house to another, and thus passed through the country ; with this a bonfire was lighted, and the cattle were made to pass through its smoke, which was supposed to render them invulnerable to the attacks of the disease.

In Scotland, cattle are the subject of scarcely less superstitious maxims. In many districts, if a cow has been seized with *phthisis pulmonalis*, or any inflammatory disorder, or if she has become *hide-bound*, or rumination has been accidentally stopped, the wise people called in to minister know but one explication of the mystery : the beast has got the *tail-ill*. This is an imaginary disorder supposed to reside in the tail, and to show itself by eating away the bone of that organ. To prove its presence, the cow-doctor will ask the owner of the animal to feel the tail near its extremity, and satisfy himself that the bone is "clean awa," the fact being that in that region there is only a soft cartilage. Under this miserable delusion, the people make incisions in the tails of cattle, into which they rub salt, soot, or horse turpentine, thus adding to the pains of the animal, without doing the least for the relief of the real malady. Often a considerable portion of the tail is cut off, by way of making the cure more certain. An educated veterinary surgeon of our acquaintance informs us that, in some cow-houses in his neighbourhood, there is not a cow with a tail above sixteen inches long.

meat and other fresh provisions for her family.
han she will possess two advantages—that of
the best pieces, and of getting them at the
ice. The frequency of her visits to the mar-
of course, depend on the number of her family,
taste as to the staleness or freshness of the
be purchased. If circumstances permit, it is
to purchase a whole week's provisions at a
least the chief things which will be required
ensuing eight days. We would recommend a
e to act upon a system in varying the kinds of
ich she buys, not only as they may be suitable
asons, but as calculated to promote the health
ly. It is of considerable consequence that food
variety; indeed, sameness of diet will produce
injurious effects, whatever be the quality of
which is taken. Let the housewife, therefore,
a little ingenuity and judgment in her market-
ditions, contriving to present at table a succes-
different descriptions of animal and vegetable
, for example, sometimes meat roasted, and
s boiled or stewed; sometimes fresh meat, and
s salted; sometimes butcher-meat, and some-
; and so on, according to taste and other cir-
es. It does not necessarily follow, that, in
ing the bill of fare, greater expense is incurred
e same kind of articles were continually pur-

at meat is that which is moderately fat. If it
r almost free of fat, it is an indication that the
as been ill fed, and that the meat will prove
d tasteless. Avoid lean beef—it forms wretched
d will be dear at any price. The fat of good
ightly yellowish; the fat of good mutton is pure
The flesh of both beef and mutton should be
r red colour. The mutton of black-faced sheep,
downs, is the most tender or sweet, and may
by the shortness of the shank. Mutton is in
n at between four and five years, but is seldom
d older than three years. Cow and bull beef
derably inferior to ox beef.

The age of game is of little consequence, as it is hung for a considerable length of time before dressing.

All kinds of fish, except salmon, should be purchased as fresh as possible. Freshness in cod, haddock, and generally all fish, is indicated by stiffness in all parts of the body, and a clear glittering appearance in the scales. Freshness is likewise known by the smell. If there be the least staleness, the fish has an offensive odour. As tricks are sometimes performed with the eyes and gills, freshness of appearance in these is not to be trusted.

It is very difficult to ascertain when eggs are perfectly fresh. There are different rules on the subject, but they are all liable to failure. One mode of judging, is to hold the egg between the eye and the light of a candle, shadowing the eye with the hand; if the appearance is universally luminous without any cloudiness, the egg is fresh; if cloudy or not uniformly luminous, it is probable that the egg is unfit for use.

Butter may be easily selected by the taste and the smell; but in buying both eggs and butter, it is best to deal with a person on whom you can rely, as it is troublesome to be continually seeking out and examining these articles to determine their freshness.

Good ham and bacon have a fresh savoury smell; the fat is white, and free from any yellowness. If it be yellow, reject it, as it will soon become rank and rusty.

Flour for culinary purposes should be new and fresh. Old flour is liable to spoil and become full of animal life, in which condition it is unfit for pastry and other dishes. The best kind of salt for the kitchen is that which is purchased in lumps and cut down.

Keeping Meat.—A larder is a place where fresh meat is kept till it is in a fit state for being cooked, and where cold meat or any other kind of food may be set aside. The larder should be cool and dry, with the outer air playing freely through it. It should also be impervious to vermin or insects, particularly flies. Two or three shelves, and a few strong iron hooks for hanging the meat, are the only furniture.

Beef and mutton are always improved by hanging some time after being killed before they are cooked. The length of time which they may be kept depends on the state of the weather. The best weather for the purpose is when the atmosphere is cool, clear, and dry; in such circumstances, beef and mutton may hang from four to ten days; mutton, if well managed, may hang a fortnight or even three weeks. A moist thick atmo-

warm, as in that case the jui
remain to enrich the meat.

Keeping Vegetables.—Veget

rs to roast; but this, as well as the time for the other parts, must be regulated by the size weight of the meat, and can be learned only by . The joint of mutton should be basted the beef, with its own dripping. A gravy for roast as in the case of beef, may be made by pouring ot water and salt over it; if wanted of a richer a gravy sauce may be made from beef, as under the head SAUCES. Most persons prefer well done." In roasting the loin, take away rrounding the kidney, otherwise the dish, on ought to table, will, when cut up, be floated The back-ribs and loin of mutton ought to ointed or cut before being put to the fire.

st Venison.—Venison is roasted in the same as mutton, but requires longer time at the fire. h a dry meat, and the fat is so easily melted, hould be covered with buttered paper, and well Serve with a good gravy and currant jelly.

st Veal.—The best parts of veal for roasting fillet, the breast, the loin, and the shoulder. t and the breast should be stuffed, particularly ; the stuffing to be composed of crumbs of hopped suet and parsley, a little lemon peel, per and salt, wet with an egg and a little milk. e should have a slow fire at first, and will re- ger time to dress than beef or mutton. Let basted with butter when there is not sufficient from the joint. The gravy for roast veal is e usual hot water and salt, or thin melted oured over the meat.

st Fillet of Veal.—The fillet of veal, which is the hy part of the hind leg, requires care in the ion for roasting. The knuckle or bone must ut neatly, without disfiguring the joint; then flap, as above; roll it up firmly, and bind it e or string. Allow the stuffing in this, as in cases, room to expand in dressing. Cover the buttered paper, and baste the piece frequently ter. Take off the paper a short time before is done. Gravy as above. This dish may be d with sliced lemon.

st Lamb.—Lamb also requires to be well It is usually dressed in quarters; all parts, rly the spinal bone, should be well jointed or e butcher or cook; and the ribs of the fore broken across the centre, in order to accom- he carver. In roasting, baste, as already de- with its own dripping. The gravy for lamb the same as for beef or mutton, namely, hot d salt poured over it; it is also customary to up with mint sauce in a small tureen.

st Pork.—Pork requires a longer time in than any of the preceding meats. When is to be used, it must be composed of chopped onion, pepper and salt. The pieces should be d well scored in regular stripes on the outer enable the carver to cut slices easily. Before o the fire, rub the skin with salad oil, to prevent ring, and baste very frequently. The basting done by rubbing it with a piece of butter in a ag, where there is not enough of dripping. The r pork may be the same as for other joints, hot d salt poured over it on the dish. It is con- an improvement to have apple-sauce served in ureen, as it assists in overcoming the richness ness of the meat, and imparts a slight acidu- our.

st Sucking-Pig.—The animal being properly l and cleaned by the butcher, the cook will to cut off the feet, and fill the inside with a composed of chopped sage, crumbs of bread, epper, and salt. The quantities of these re- ingredients must be regulated by the judgment e of the individual. The principal ingredient . The stuffing being mixed and filled in, sew slit. No skewering is required. In roasting, th butter, as directed for pork. The time for will be from two to three hours, according to

the size. The skin should be crisp, and nicely browned. Before bringing to table, split down the back from head to tail, and lay it flat in the dish with the skin side uppermost. The head is cut off, and, being split in two, a half is laid at each end. The brains are taken out, and, with the liver, which has been previously boiled and finely chopped, is mixed either with beef or veal gravy in a small tureen. Apple-sauce is also used. This is the most approved mode of serving up sucking-pig.

To roast Bullocks' Heart.—Wash the heart well, freeing it completely from blood. Then fill all the openings at the top or broad end with a stuffing composed of crumbs of bread, chopped suet, parsley, pepper and salt, moistened with an egg and a little milk. Suspend with the pointed end downwards. An hour and a half or two hours, according to the degree of heat, will cook the dish. It should, however, be well done. Send to table with beef gravy.

To roast Pigeons.—Pick and draw them well, and truss, keeping on the feet. Make a stuffing of the liver chopped, crumbs of bread, minced parsley, pepper, salt, and a little butter; put this inside. Make a slit in one of the legs, and slip the other leg through it. Skewer and roast them for half an hour, basting them well with butter. Serve with brown gravy in a small tureen. Some serve roast pigeons, or game, with toast bread beneath them, and bread sauce.

To roast Fowls.—Pick, draw, and singe them. A fowl should be so cleanly or well drawn as to require no washing. Take care not to break the gall-bag in drawing; if the gall be spilled, it will communicate a bitter taste to every part it touches. Press down the breast-bone. Break the legs by the middle of the first joint, drawing out the sinews, and cutting of the parts at the break. It being proper that roast fowls should have a neat appearance at table, it is customary to truss them, that is, to fix their legs and wings in a particular position. This is done by fixing down the knees of the animal close to the tail by a skewer or piece of string, leaving the stumps of the legs projecting. The pinion ends of the wings are then turned round on the back, the liver being placed as an ornament in one wing and the gizzard in the other. Cut the head off close to the body, leaving a sufficiency of the skin to be tied or skewered on the back. Baste well with butter for some time after putting to the fire. Suspend neck downwards. The time of roasting will vary from half an hour to an hour, according to the size of the chicken or fowl. When fowls are large, they are frequently stuffed like turkey.

Serve roast fowls with melted butter or gravy sauce. Before sending to table, remove all skewers and strings which may have been used in trussing. This, which should be done in all cases of serving dishes to table, is too frequently neglected, and shows slovenliness in cookery. Fowls and all other feathered animals are served with the breast upwards.

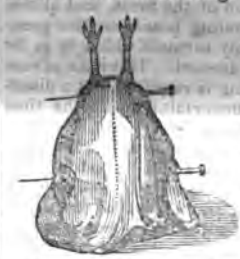
To roast Turkey.—Pick, draw, and singe the turkey well. Press down the breast-bone, and follow all the directions given for trussing fowls. The breast should be stuffed with crumbs of bread, minced beef suet or marrow, minced parsley, a little nutmeg, pepper and salt; wet it with milk and egg; a little sausage meat may also be added. On finishing, sew up the orifice or neck. Before putting to the fire, cover the breast with a sheet of writing-paper well buttered, to preserve it from scorching, and which may be removed a short time before taking from the fire, to allow the breast to be browned. Baste well with butter. A turkey will take from an hour and a half to two hours. Serve with gravy sauce and bread sauce.

To roast Partridges.—Pick, draw, singe, and clean these birds the same as fowls. Leave the head on. Make a slit in the neck, and draw out the craw. Twist the neck round the wing, and bring the head round to the side of the breast. The legs and wi trussed in much the same manner as fowls, are left on, and crossed over one into the ot in the annexed figure. Baste well with but clear fire. When about half done, dust s over them to be browned. A partridge wi twenty minutes to half an hour, and a pa quarters of an hour. Serve on toasted b gravy and bread sauce; the toasted bre dipped in the gravy.

Grouse and blackcock should be dressed in the same manner; the head being tru the wing. Snipes and woodcocks are not dr

To roast Goose.—Pick, draw, and singe the Cut off its head and neck. Take off the legs a the first joint. The portions of the legs and are left are skewered to the sides. Stuff wi sage and onion, and crumbs of bread, with salt. The skin of the neck must be tied s prevent the gravy from running out. Paper for a short time. A goose does not requir basting as fowl or turkey, for it is naturally will require from two hours to two hours a roasting. It ought to be thoroughly done, gravy sauce and apple sauce. The liver, giz neck, feet, and the pinions of the goose, for termed the *giblets*, and compose a good stew

To roast Ducks.—Pick, draw, and singe Take off the head. Dip the feet in boiling wa off the outer yellow skin. Truss them neat the feet flat upon the back. Stuff as in t goose, and serve with the same sauces. A du about an hour in roasting.



To roast Fo Pick, singe, and d the same as fow them by twisting round one of the turning both wi back. The legs on each side, in same manner as fowl, the feet bei as here represent with beef gravy sauce.

To roast Hare.—A hare will keep with on it, and paunched, for about three wee weather. It is then fit for roasting. Fir the feet, and commence drawing off the sk hind legs, proceeding along the body to the careful not to tear the ears in skinning the and wash well in several waters, and then w dry. Stuff with crumbs of bread, chopped bit of beef or veal suet chopped finely, a lit

lemon-peel and nutmeg, a piece of liver boiled chopped or grated, and pepper and salt; t moistened with an egg, a little milk, and a sp ketchup. The skin of the belly afterwards to Commence trussing, by placing the hind and flat against the sides. To make the hind leg the under sinews must be cut. Fix the hea the two shoulders, on the back, by running through it into the body. In roasting, suspe downwards. It may be basted first with m wards with butter, flouring it lightly. It wi from an hour and a half to two hours. Th dished back upwards, as represented above, a with a dish of rich beef gravy, and a dish of cur

ite flat. Dust with pepper. They should be more slowly than steaks or chops, being thicker, iring to be more thoroughly dressed. Rub oily with a little butter, to prevent the skin from . In no case should the skin be taken off before ling. On dishing, sprinkle with salt.
e sauces are used—parsley and butter, melted eef gravy, or mushroom sauce.

FRYING.

g is as expeditious a mode of cooking as broiling, less activity and care, and is more thrifty. The e of frying is a point of material consequence, be thus explained. It affords a ready means ng in a savoury manner many odd pieces of l or cold meat, thereby saving that which might e have been thrown away as useless. A skilful e, with the aid of a frying-pan and some mixvegetables, such as onions and potatoes, along light seasoning, will make a small portion of e a large family.
ng-pan should be of malleable, not of cast, iron. t also be thick in the bottom, and of an oval should always be kept clean, by being washed ing water, but not scoured. In all cases of small piece of dripping, butter, or lard, must into it and melted, to prevent the meat from . In frying all meats, except those which ciently fat in themselves, it is necessary to use d *of* grease or fat. The best fat for this purril, which is more economical, and less likely than butter. When lard is not employed, the titute for it is dripping.
Beef-Steaks.—Cut the steaks as for broiling. being put into the pan, shift and turn them y. Let them be done brown all over, and a hot dish when finished. Gravy may be pouring a little hot water into the pan after s are out, and the fat poured away, with per, salt, ketchup, and flour. The gravy so to be poured into the dish with the steaks. table immediately.
ns be required along with the dish, cut them lices, and fry them till they are soft. They fried after the steaks, and merely with part in which the beef has been fried.
Mutton Chops.—They require to be cut in the ner as for broiling, and may be dressed no the preceding directions for steaks. None ose which flows from the chops is to be used h them, and the whole must be poured away eparing the gravy.
Veal Cutlets.—Veal cutlets form a delicate dish, d be fried with butter. The best cutlets are fillet, because they are free from bone; the nd loin—that is, the back-ribs or loin—may but the bone must be cut away, which causes Cut them half an inch in thickness. They be dressed slowly and thoroughly, and should ght brown tings when finished.
r and more tasteful way *of* dressing cutlets, is them in a beat egg and then strew them with bread, and parsley chopped very fine, along er and salt, after which put them in the pan. requires more lard or dripping this way than d plain.
may be made for cutlets the same as for fried t add a little juice of a lemon, and skim the re pouring it over the cutlets.
and Chops.—Lamb chops may be either simply e same manner as mutton chops, or dressed and crumbs of bread (but with no parsley), ease of cutlets. Gravy made in the pan, as teaks.
Pork Chops.—Pork chops should be cut rather be thoroughly dressed. They may be either ed in the same manner as chops, or fried after ed in egg, and sprinkled with crumbs of bread, and onion finely chopped. No gravy, or

batter so formed, after which fry in lard or good fresh dripping, of which there must be a sufficiency in the pan almost to cover the tripe. Let it be done to a light brown. Garnish with fried parsley.

To fry Parsley.—Parsley is fried only for garnishing. It must be thoroughly dried, and fried in hot butter or dripping. After frying, lay it on a sieve before the fire for the fat to drain from it; after which, place it round the edge of the dish.

To fry Bacon, or Ham and Eggs.—The bacon should be cut very thinly in slices not more than a quarter of an inch in thickness. The best bacon is that which is alternately streaked with fat and lean. No butter or dripping is required in the pan in frying bacon, which does not need much dressing, and is soon prepared. When done, take the slices from the pan, and place them in a hot dish before the fire. Have the number of eggs required previously broken, each in a separate cup, and place them gently in the pan, so as to preserve them in a round flat shape. Let them remain in the pan till the white is set, and take them out carefully with a slice, and place them on the bacon. The tasteful appearance of this dish is spoiled, if the eggs be either broken or ragged, which is very apt to be the case if they are not previously put into cups.

To fry Collops.—The difference betwixt this dish and fried steaks, is, that the collops or pieces of meat are partially stewed, as well as fried. Cut the meat thinner than for broiling, and put the slices in a pan along with a large piece of butter and sliced onions. Cover it close, and when the meat is sufficiently dressed, add a little hot water and ketchup to the liquor already in the pan.

BOILING.

Boiling is the preparation of meat in water, and it is necessary that the vessel employed be large enough to allow the meat perfect freedom; if it be cramped, and have only a little water, it will be stewed, not boiled. In all cases of boiling, there must be a sufficiency of water to cover the meat. In boiling meat there is less waste than in roasting; and, in some cases, soup may be made of the liquor. It is a general di-

at the joint if necessary, so as to
hours of slow equal boiling will b
sized leg of mutton. Some per-
look white and tasteful, wrap it
boiling; but this spoils the liquor
safe to boil vegetables with a leg

A tasteful way of serv... take it from its liquor after boiling, and stew ...ut ten minutes in a saucepan with milk, which ... with a little arrowroot, or flour and butter, ...on with pepper and salt. This makes a deli... cheap dish.

... Cow-heel.—Cow-heel should be boiled for five ...urs, or till the bones will slip out. Serve with ...f chopped parsley and butter.

STEWS, HASHES, AND MADE DISHES.

...g is the preparing of meat by slow simmering ..., and by which all the liquor is to be used ...th the meat at table. This is a much more ...mode of cookery than boiling, because the sub... the meat is partly in the liquor, and is seasoned ...a high relish or flavour. Generally, much more ...made of meat by stewing, than by roasting, ... or frying, because nothing is lost in the pro... dressing. It also possesses the decided advan... being a way by which meat may be dressed for ... whose time of dining is uncertain. A stewed ...r instance, will keep warm and in good condi... an hour, but a broiled or fried steak cannot ...minute after dressing.

... a piece of Beef, or make Beef Rissoll.—Take a ... heel—the brisket or rump, or any other piece ...l become tender. Put a little butter in the ...of the stew-pan, and then putting in the meat, ... fry or brown it all over. Then take it out, ...two or three skewers in the bottom of the pan; after which replace the meat, which will be prevented from sticking to the pan by means of the skewers. Next, put in as much water as will half cover the meat. Stew it slowly, with the pan closely covered, till done, with a few onions, if required. Two hours are considered enough for a piece of six or eight pounds. When ready, take out the meat, and thicken the gravy with a little butter and flour. Cut down into handsome shapes a boiled carrot and turnip, and add them to the liquor; season with pepper, salt, and a little ketchup. Boil all together for a few minutes, and serve in a hash dish.

To stew a Shoulder of Mutton.—Take a shoulder of mutton, and cut out the blade bone without injuring the form of the meat. Make a stuffing of crumbs of bread, chopped suet and parsley, a little green or dried sweet herbs, chopped onion, and pepper and salt, moistened with egg and milk. Lay this stuffing in the place from which the bone was cut out; then roll it up, and skewer or bind it firmly with tape. Rub the bottom of a stew-pan with suet or butter, and brown the mutton. When sufficiently brown, lay two skewers in the bottom of the pan; add a little stock or boiling water, and let it stew for an hour and a half; the gravy drawn from itself will be sufficiently rich for sauce, seasoned with pepper and salt. Skim it before serving, to remove the fat.

To stew Steaks and Chops.—Cut the beef in slices rather thinner than for broiling or frying. Put them in a stew-pan, with water sufficient to make gravy. Add grated carrot, turnip cut in small squares, and pepper and salt. Stew for an hour, or till tender. Skim if necessary. When done, thicken the gravy with a little arrowroot or flour, and flavour with ketchup. Some persons add a little maccaroni or vermicelli, which requires from ten to twenty minutes' boiling along with the stew.

Mutton chops are stewed in the same manner, but require to be trimmed of the superfluous fat, and more carefully skimmed. This is called *harrico of mutton* when the chops have been previously browned. The same directions will serve for stewing slices or pieces of any other kind of meat.

To stew Veal.—The best parts of veal for stewing are the fillet, the breast, and the shoulder. The shoulder must be stuffed when the knuckle is cut out, which must be done neatly, without disfiguring the meat; the stuffing should consist of bread-crumbs, minced suet, chopped parsley, grated lemon-peel, white pepper and salt, moistened with egg and milk; fill the shoulder, and sew it up. Rub the bottom of a large stew-pan with butter, lay in the veal, and brown it on both sides. When sufficiently brown, put in a pint of cold water, and stew it slowly for two hours, or, if large, two hours and a half. Before it is to be dished, draw off the gravy, and if not thick enough, brown a little butter, and dust in a little flour; put it amongst the gravy, and season with Cayenne, salt, and the squeeze of a lemon (a glass of sherry will be an improvement); skim the sauce, and pour it over the meat before dishing.

To stew Kidneys.—Cut the kidneys into slices; wash them, and dry them with a clean cloth; dust them with flour, and fry them with butter until they are brown. Pour some hot water or beef gravy into the pan, a few minced onions, pepper and salt, according to taste; let them stew slowly for an hour, and add a spoonful or two of mushroom ketchup before dishing.

To stew Pigeons.—Pick and wash the pigeons well, trussing them as fowls for boiling. Put a piece of butter and some pepper inside; dust them with flour, and brown them in a covered stew-pan with a good piece of butter; put in a little flour; add some gravy or hot water. Season them highly, and let them stew slowly for twenty minutes or half an hour. Before dishing, add half a glass of port wine, if the flavour be approved.

To stew Rabbits.—Wash the rabbits well, cut them in pieces, and put them in to scald for a few minutes. Melt a piece of butter, in which fry or brown the rab-

given to the following excellent preparation of cold meat. Cut the meat in slices; pepper, salt, and flour them, and lay them in a dish. Take a few pickles of any kind, or a small quantity of pickled cabbage, and sprinkle them over the meat. Then take a tea-cup half full of water; add to it a small quantity of the vinegar belonging to the pickles, a small quantity of ketchup, if approved of, and any gravy that may be set by for use. Stir all together, and pour it over the meat. Set the meat before the fire with a tin behind it, or put it in a dispatch, or in the oven of the kitchen range, as may be most convenient, for about half an hour before dinner-time. This is a cheap and simple way of dressing cold meat, which is well deserving of attention.

To hash Cold Beef or Mutton.—Cold roast beef, or cold roast or boiled mutton, may be dressed as a hash in the following manner. Cut the meat from the bones into small pieces, and lay them aside. Then put the bones in a stew-pan, with a little water and sliced onion. After stewing for a short time, take out the bones and put in the meat. When the meat is perfectly hot, thicken with a little flour and butter, and season with pepper and salt, and a little ketchup. Dish the hash, and stick small triangular pieces of dry toasted bread round the inner edge of the dish.

To dress Cold Boiled Beef, or make Bubble and Squeak.—Cut the beef in slices of about the third of an inch in thickness. Fry the slices till lightly browned, and heated through. Then take them from the pan, and place them on a warm plate before the fire, to keep hot. Fry some cabbage which has been previously boiled and chopped; stir this about a short time in the pan, and season with pepper and salt. Spread the cabbage in a dish, and place the slices of meat upon it; or heap the cabbage in the dish, and place the meat around it.

To mince Cold Veal.—Cut the veal from the bones, and mince it in small square bits, and lay them aside. Then put the bones in a stew-pan with a little warm water, to make a gravy. After stewing for a short time, take out the bones and put in the bits of veal, with a small piece of lemon-peel, chopped very fine. When perfectly heated, thicken with a little flour and butter, and season with pepper and salt, and a little lemon-juice. Dish with small pieces of toasted bread, as in hashed mutton.

To dress a Lamb's Head and Pluck.—Lambs' heads are procured [illegible]. Take the head with the neck [illegible]

as a jelly. Take the half of

up.—This is an excellent soup, if well made,
of the cheapest dishes that can be put on the
it may be formed of cold meat or marrow-
what is cheaper still, merely water, or the
which any piece of mutton, lamb, or veal, has
d. We give the following two recipes for
:—

up with meat or bones.—Take a good marrow-
he bones of cold roast beef; a slice or shank
y be added, if the flavour be liked. Break
and put them in the pot with four quarts of
. According to the thickness and quantity
take two or three pounds of the best split
put them among the cold water and bones;
two carrots, two turnips, half a dozen small
stalk of celery cut in pieces, a bunch of thyme,
whole black and Jamaica pepper. Let all
or two hours, stirring frequently, as the soup
t to burn. When the peas are quite soft and
wn, take the soup off, and put it through a
another pot; rub it well through until the
ixed with the soup. Add salt melted amongst
ter, and boil the soup again for a few minutes.
be served, cut a slice of toasted bread into
are pieces, and put in the tureen with the soup.
up without meat or bones.—Put two pounds
f peas in five quarts of water. Boil for four
en add three or four large onions, two heads
a carrot and a turnip, all cut up; and season
to taste. Boil for two hours longer. If the
me too thick, add a little water. The peas
oiled the evening before being used, and the
ey boil, the smoother and more mellow the
be; but do not put in the vegetables until the
oup is to be used. By this plan the soup does
re straining.

Broth.—This is a broth of a mild nature,
ended chiefly for invalids. Take a scrag or
of a loin of mutton, and put it into a pot with
r; the proportion being a quart of water to a
meat, which will allow for loss in boiling.
d onion may be added when not considered
Let this boil slowly for three hours, and
ll the fat before serving. The meat is sup-
be useless.

ea.—Take a pound of lean beef, which cut in
d put into a saucepan with a quart of cold

rving, strain it through a hair sieve. Season
le salt.

r method.—Take a pound of good lean beef,
cut it into very thin slices, which place in a

basin. Then pour a pint and a half of boiling water on the meat, moving it frequently with a fork or spoon, to cause the water to act upon all sides of the meat, and so extract its juices. Let it remain in the water about a quarter of an hour, after which pour the water into a saucepan, and boil it for about ten minutes. Skim, and season with salt. This is the most delicate way of making beef tea.

SCOTCH DISHES.

Sheep's Haggis.—There are different ways of making a haggis, as far as the exact composition of the materials is concerned. Some put minced tripe in it, others put no tripe. The following is the more common, and, we believe, the best manner of making it: Procure the large stomach bag of a sheep, also one of the smaller bags called the king's hood, together with the pluck, which is the lights, the liver, and the heart. The bags must be well washed first in cold water, then plunged in boiling water, and scraped. Great care must be taken of the large bag; let it lie and soak in cold water, with a little salt, all night. Wash also the pluck. You will now boil the small bag along with the pluck; in boiling, leave the windpipe attached, and let the end of it hang over the edge of the pot, so that impurities may pass freely out. Boil for an hour and a half, and take the whole from the pot. When cold, cut away the windpipe, and any bits of skin or gristle that seem improper. Grate the quarter of the liver (not using the remainder for the haggis), and mince the heart, lights, and small bag very small, along with half a pound of beef suet. Mix all this mince with two small tea-cupfuls of oatmeal, previously dried before the fire, black and Jamaica pepper, and salt; also add half a pint of the liquor in which the pluck was boiled, or beef gravy. Stir all together into a consistency. Then take the large bag, which has been thoroughly cleansed, and put the mince into it. Fill it only a little more than half full, in order to leave room for the meal and meat to expand. If crammed too full, it will burst in boiling. Sew up the bag with a needle and thread. The haggis is now complete. Put it in a pot with boiling water, and prick it occasionally with a large needle, as it swells, to allow the air to escape. If the bag appears thin, tie a cloth outside the skin. There should be a plate placed beneath it, to prevent its sticking to the bottom of the pot. Boil it for three hours. It is served on a dish without garnish, and requires no gravy, as it is sufficiently rich in itself. This is a genuine Scotch haggis.

Lamb's Haggis.—This is a much more delicate dish, and less frequently made than a sheep's haggis. Procure the large bag, pluck, and fry of a lamb. The fry is composed of the small bowels, sweetbreads, and kernels. Prepare the bag, as in a sheep's haggis. Clean thoroughly the small bowels and other parts; parboil them, and chop them finely along with a quarter of a pound of suet. Mix with dried oatmeal, salt, and pepper, and sew the mixture in the bag. Boil it, and attend to it in the same manner as a sheep's haggis.

Broth or "Kail."—Broth is made of beef or mutton, but mutton is preferable, and is generally employed. The best broth is made as follows:—Put into a pot three quarts of cold water, along with a cupful of pearl barley, and let it boil. As soon as it boils, put in two pounds of the best part of the neck or back ribs of mutton. Allow it to boil gently for an hour, skimming occasionally, and watching to prevent boiling over. Then add one carrot grated, two small turnips cut in squares, a few small onions shred; also two or three pieces of carrot and turnip uncut. Instead of part of these vegetables, according to taste put in the half of a small cabbage chopped in moderately sized pieces, or if cabbage cannot be procured, a similar quantity of greens. Leeks are also used instead of onions. Boil the whole for an hour longer, adding if necessary a small quantity of hot water to compensate the loss in boiling. The broth is now supposed to be done. Season with salt only, and serve in a tureen. The meat, which is not expected to be ov served in a separate dish, garnished with pieces of turnip and carrot. By this prepa the broth and meat are used, so that a sm of meat produces food for a large number.

Hotch-Potch.—This is a dish only to be perfection in summer, when green peas ar Put on two quarts of water, and when it b three pounds of the back ribs of mutton or l off the fat if there be too much. Put in wit two or three carrots cut into squares, and also three or four sweet young turnips cu cauliflower and a lettuce cut down, a few on shred, a little parsley, and about a pint of s peas. Boil this for an hour and a half, the the meat and cut it in chops, laying it ag another pint of young peas, seasoning with pe salt; and when these peas are done, put in t In a few minutes afterwards, serve up the s tureen.

Sheep's Head.—Procure as good a sheep's possible. The first thing done is to singe it w iron, so as to free it completely from every p wool. This process is always performed in by a blacksmith, or some other person who business of singeing heads. The horns shou been previously sawed off by the butcher. Wh and ready for the cook, soak the head for se in warm water, and then scrape it till it is p clean, and as nearly white as possible. The h now be split, and the brains removed. Take eyes, and scrape and clean out the nose; aft wash the head again, and let it lie in warm wa short time. It is usual to procure the trotte with the head, and to subject them to a simi ment, as regards singeing, cleaning, and washi head and trotters being now ready for the pot, p in with a sufficiency of water, and let them bo skin is soft and tender, which may be in three When ready, serve with the trotters round t and garnish with boiled carrot and turnip. Se sons serve with parsley and butter.

Minced Collops.—Take a pound of good ju and a proportionate quantity of suet. Mince t very fine, as if for sausages, taking away an gristle or skin. Melt a piece of butter in a fry and then put in the collops. Stir them well, little flour, a little hot water or gravy, and sea pepper and salt, and a little ketchup. Onion chopped and put in along with the meat, if n Ten minutes will dress a pound, which will dish for four or five persons. Serve in a hash

Potato Soup.—Take any bones of cold roast a marrow-bone, or, failing these, a piece of s which put into a pot with cold water, according quantity required. Let it boil a short time; t in a quantity of potatoes well peeled or scraped have been previously soaked in boiling water to any disagreeable flavour from them. Add als two onions cut in pieces, a little pepper and salt all boil for half an hour.

SAUCES AND FLAVOURS.

Sauces are liquid preparations to be used as flavour or relish to dishes, and are of various A number are formed of melted butter, with an of some other ingredients; others are in the gravies drawn from fresh juicy meat; and a th are composed partly of water, and some preserv diments, or spices. There is little merit in m good sauce when a person has good and proper rials to make it with. The chief merit consists nishing a fine flavour from inadequate materi for instance, giving a rich flavour of meat to of potatoes, or some other plain dish, when n has been employed. This can only be done by k the qualities of various vegetable products, a these, by means of cookery, may be made to p the juices of animal food. The vegetable pro

ich by far the most can be made by a skilful cook, onions, mushrooms, and carrots. Onions and shrooms, alone, furnish the most effectual substi- es for animal juices, and may be dressed so exqui- sly as hardly to be distinguished from the gravy of ef.

Onion Flavour.—Onion flavour is made by stewing. ke several large onions, and remove the thin outer m from them. Put them in a saucepan with a little t and flour, and a small piece of butter or dripping, prevent their burning. Cover them quite close, and by the fire to brown and stew gently. Two hours dress them, and at the end of this time they will quite soft, and, with the addition of a little water, will yield a rich gravy. This may be used to fry toes with, or to flavour any other dish.

Mushroom Sauce.—Pick out the stems, and skin the hrooms and the stems. Cut them in small pieces, wash them. Then put them in a saucepan, with er more water than will cover them. Let them gently for about half an hour, or till they are soft. will now have yielded a fine rich sauce. Stir in le flour and butter kneaded together, and season pepper and salt. This preparation may be eaten potatoes, the same as meat; it also forms an ex- nt sauce to many dishes.

Melted Butter.—This must be made of fresh butter. down the butter into small pieces, and put them a small saucepan with cold water, in the propor- of an ounce of butter to a tablespoonful of water. w in flour from a dredger with the one hand, while the other you turn the saucepan rapidly round, so cause the flour to mix without lumping. A small tity of flour is sufficient. You now for the first take the saucepan to the fire, and continue turning aking it till the butter is thoroughly melted. When ils, it is ready; it should then have the consistency ch cream. If it should oil in making, it may be ally recovered by putting a little cold water into d pouring it several times into and out of a basin. his sauce is the foundation of a number of other es, various additions being made to it for the sake riety.

Onion Sauce.—Skin the onions, and boil them in ty of water. When they are soft, take them from water, and chop them very fine. Melt butter as e, and stir them in, seasoning with a little pepper salt.

Egg Sauce.—Boil three or four eggs till they are hard. Peel and chop them down, and then stir in into melted butter. Season with a little pepper salt.

Cradle Sauce for plum-pudding.—Melt butter, as e directed, and stir into it a glass of sherry, half a of brandy or rum, a little sugar, grated lemon- , and nutmeg. Do not let it boil after the spirits added.

Lobster and Crab Sauce.—Melt the butter, as above ected. Pick out the meat of a boiled lobster or b; chop it down very fine, and put it amongst the er. Season with Cayenne pepper, and salt. If the ter be procured raw, with berries or spawn on the ide, these should be taken off previous to boiling, being mashed in a little cold water, may be added he sauce after the lobster is put in. By boiling a e, the whole will become a bright red. This forms improvement on common lobster sauce.

Bread Sauce.—Grate down crumbs of bread. Put it saucepan on the fire, with as much sweet milk as allow it to be thick. Add a piece of sliced onion, stir it till the bread is soaked and the sauce is quite oth. Season with pepper and salt.

Mint Sauce.—Take the leaves of fresh green mint. sh them, and after drying them, chop them very . Mix them with vinegar, and add a little sugar.

Beef Gravy.—A pound and a half of beef will make int of good gravy. Cut the beef in slices, or score very deeply. Place it in a saucepan, with a bit of ter to prevent it from sticking, and a sliced onion. Brown the meat gently, being careful not to let it burn. Cover it closely, and let it stand beside the fire for about half an hour, to allow the gravy to run from the meat. Then put in about a pint of hot water, and let it boil slowly for an hour and a half, with some whole pepper. Some persons put in to boil along with it, a piece of bread toasted hard and brown, which thickens the gravy a little and adds to its richness. Season with salt, and strain it through a hair sieve.

FISH.

Fish are dressed in a variety of ways, according to the taste of individuals. They are boiled, broiled, baked, stewed, and fried; but the most common modes of preparation are boiling and frying—boiling when required to be done in a plain way, and frying when a high relish or flavour is to be given to them. In all modes of preparing fish, much care is required to prevent them from being broken or disfigured.

To boil Salmon.—Clean out, scale, and rinse the fish in water. Then put it in a good roomy fish-kettle, with plenty of cold water, and a handful of salt. The usual time allowed for boiling salmon is twelve minutes to each pound, but this must in a great measure depend on the thickness of the fish. The way to ascertain when it is ready, is to raise one end from the water, and try if a knife will pass easily betwixt the fish and the bone. If it pass easily, it is dressed sufficiently. When done, lift it immediately from the water, and place the fish drainer across the kettle, to allow the water to drip from the fish. Serve on a dish with a fish plate and white napkin under it, the napkin being next it. Garnish with green parsley. Sauce—plain melted butter, parsley sauce, or lobster sauce in a tureen.

To broil Salmon, or Salmon Steaks.—Cut slices from the thick part of the fish, and having cleaned and scaled them, dry them, and dust them with flour. Broil them on a gridiron over a clear fire. When ready, rub them over with butter, and serve hot, with any of the sauces used for boiled salmon. Slices of hung or *kippered* salmon are broiled in the same manner.

To fry Trouts, or similar Fish.—Trouts of a moderate size are dressed whole, and frying is the best mode of preparation. Take the trouts, and clean out and scale them. Dust them with flour, and put them in a frying-pan with hot dripping or lard. Turn them, so as to brown them on both sides. Lift them out and serve them on a dish; they will be improved by laying a napkin under them to absorb the grease.

In the country parts of Scotland, trouts are rubbed with oatmeal instead of flour, and some reckon that this improves the flavour.

To boil Turbot.—Select a thick fish of a white creamy colour. After cleaning, but not cutting any part except in gutting it, lay it in salt and water, with the addition of a little vinegar, and let it soak a short time before boiling, Put it with the white side or belly upwards in a fish-kettle on the fire, with plenty of cold water, a handful of salt, and a cupful of vinegar. Let it heat slowly, and boil for half an hour after it has come to the boil. When done, serve with belly upwards, and garnish with any small fish fried, or with parsley and scraped horse-radish. Sauce—lobster, oyster, or plain butter.

To bake Turbot.—Cut a small turbot into slices, which clean and free from bones. Dip the slices in beat egg, and roll them in a mixture of crumbs of bread, minced parsley, pepper and salt. Place them in a dish well buttered all round, and bake them in an oven not very hot, or in a bachelor's or Dutch oven before the fire. They must be basted frequently with butter. When done, lay the pieces in a dish, and pour round them lobster or oyster sauce, highly seasoned with Cayenne pepper, salt, and ketchup. Instead of being baked, slices of turbot may be fried after being prepared as above, and served with plain butter sauce.

To boil Cod.—Wash and clean it, and boil as directed for turbot. Serve it on a napkin, garnished with parsley and scraped horse-radish. Sauce—oyster sauce.

To dress a Middle Cut of Cod.—Clean the piece of cod, and make a stuffing of bread crumbs, parsley and onions chopped small, pepper and salt, a bit of butter, moistened with egg. Put this stuffing into the open part of the fish, and fix it in with skewers. Then rub the fish over with beat egg, and strew crumbs of bread, pepper and salt, over it. Stick also some bits of butter on it. Set it in a bachelor's or Dutch oven before the fire to bake. Serve with melted butter or oyster sauce.

To boil Haddocks.—This is the simplest of all operations. Select haddocks of a middle size. Clean them well, and wash them, and boil with a little salt in the water. Twenty minutes or half an hour's boiling will be sufficient. Serve with oyster sauce.

To dress Haddocks.—This is a most delicious dish when well prepared. Take pretty large haddocks, which clean and wash well. They will be firmer and better if they lie for a night in salt. When to be dressed, wash them and dry them. Cut off the head, tail, and fins; then skin them, being careful not to tear the flesh. Cut the flesh neatly from the bone, and divide each side into two pieces. Dust them with flour, dip them into beat egg, and strew bread crumbs over them. Fry them in a frying-pan, with a sufficiency of hot dripping or lard to cover them. Be careful that the dripping is not hot enough to scorch the fish. The way to ascertain the proper degree of heat of the fat, is to dip a thin slice of bread into it, and when it makes the bread of a light brown tinge, put in the fish. If the fat be too hot, it will make the bread of a deep brown. Turn the pieces carefully, so as to brown both sides, and when done, lay them before the fire on a drainer for a few minutes. Serve in a dish, garnished with parsley. Sauce—oyster sauce, or plain melted butter.

The fat in which haddocks are fried will answer the same purpose again, if put through a hair sieve, and poured in a jar, and kept in a cool place.

To fry Skate, Soles, Flounders, Whitings, and Eels, and any other white fish.—Skate and soles are skinned and dressed in the same manner as haddocks, but soles are fried whole, not cut in pieces. Flounders are likewise fried in the same manner, whole, but do not m

of flavour. They should also dressed, and not permitted to lie after they are ready for dishing. and greens are the better for be carbonate of soda in the wate their green appearance. The material resembling flour in ap obtained from any druggist. C require great care in boiling, for and their appearance is spoiled. vegetables depends so much o and size, that no directions can The best way to ascertain whe pass a fork through the stem.

.—Take chops from the back ribs or loin,
t the bones. Lay the chops flat in the dish,
over each layer a mixture of minced parsley,
er, and salt. Add a little gravy, which may
om the bones. Cover as above directed, and
ther more than an hour, for veal requires to
ked.

Pie.—Pick and clean the birds well. Cut off
and truss them by turning the wings on the
ing off the feet, and drawing the skin of the
the legs. Put a bit of butter, and a little
f salt, inside each bird. Place a single layer
veal in the bottom of the dish. Lay the birds
t, with breasts upwards, and with the gizzards
round them. Some add a few whole hard-
s. Add a little gravy or water. Cover as
ted, and bake for an hour.

r Tarts.—After tarts are baked, they are
ized on the top, to improve their appearance.
is done in the following manner:—Take the
n egg, and beat it till it is a froth. Spread
is with a brush or feather on the top or cover
, and then dredge white sifted sugar upon it.
tart to the oven for about ten minutes.

ie.—Pare and take out the cores of the apples,
ch apple into four or eight pieces, according
e. Lay them neatly in a baking dish, season-
rown sugar, and any spice, such as pounded
cinnamon, or grated lemon-peel. A little
rmalade gives a fine flavour to the pie. Add
ter, and cover with puff paste, as above
flake for an hour.

ry Pie.—Pick the heads and stems from
ard gooseberries, and rub them with a towel
en. Fill the dish with them, and add a con-
quantity of brown sugar, with a very little
ver as above directed, and bake for upwards
r. Some persons stew the gooseberries in
re putting them in the dish, in which case
re less baking.

Pie.—Take stalks of fresh-pulled rhubarb,
l the leaf, and strip off the skins. Cut the
pieces of an inch long. Fill the dish, add-
of sugar. Cover as above directed, and bake
n hour. Some persons stew the rhubarb
ing; the advantage of this is, that more can
the dish, for it shrinks considerably in dress-

ry, Raspberry, and other Tarts.—Cranberries,
e, and other small fruits, may be made into
same manner as gooseberries. All require
d and wiped, and to have sufficient sugar to
em. The dish should also be well filled, and
er in the middle than the edges, for the fruits
onsiderably in bulk in baking.

ie.—Mince pie is a composition of meat, fruit,
ices and seasonings, and also spirits. The
is a properly proportioned mixture:—Take
a pound of beef suet, and a pound of roast
essed fresh bullock's tongue; also a pound
ared and cored, minced separately from the
eat; a pound of currants washed well picked,

with narrow bars of paste crossed all over, or stamped leaves. Bake for half an hour.

PUDDINGS AND DUMPLINGS.

Care should be taken in making puddings to have the suet and the eggs which are put into them perfectly fresh. If there be any doubt of the freshness of the eggs, break each individually in a tea-cup, for one bad egg will spoil all the eggs in the dish. The cloths used for puddings should be of tolerably fine linen. Let them be carefully washed after using, and laid aside in a dry state, ready for the next occasion. Before putting the pudding into the cloth, dip the cloth in boiling water, and after the water has run from it, spread it over a basin, and dredge it with flour. Every pudding should be boiled in plenty of water, so as to allow it room to move freely; and it must be kept constantly boiling. It is a general saying among cooks, that a pudding *cannot be too well boiled*, and it is certain that there is much more danger of boiling it too short than too long a time. When you take the pudding from the pot, plunge it for a few seconds into a jar of cold water. This will chill the outside, and allow the cloth to be taken away without injuring the surface. The best way to dish a pudding, is to place it with the cloth in a basin, then open the cloth, and lay the face of the dish upon the pudding; turn the whole upside down, lift off the basin, and remove the cloth.

Plum Pudding.—A plum pudding may be made either rich or plain, according to the quantity of fruit and spices put into it. The following is the direction for making what would be considered in England a *good Christmas pudding*:—Take a pound of good raisins and stone them; a pound of currants, which wash, pick, and dry; a pound of rich beef suet minced, and a pound of stale bread crumbs, and half a pound of flour. Mix the bread, flour, and suet in a pan. Beat six eggs in a basin, and add to them about half a pint of sweet milk. Pour this egg and milk into the pan with the suet and flour, and beat it well with a flat wooden spoon for some time. Then stir in the currants and raisins, mixing well as you proceed; mix in also a quarter of a pound

bread to swell. Then beat

Blamange.—There is a moss of a peculiar kind,
the sea-shores of Iceland, Ireland, and other
which is of a glutinous quality, like isinglass,
ch, when boiled in milk, forms a fine smooth
lly. The discovery of the properties of this
recent, and is yet not very generally known.
ll, therefore, be particular in our directions.
s is called Iceland or Irish moss; it is sold by
s, and when bought resembles dried sea-weed
owish colour. Take one ounce (which will pro-
st twopence), and pick from it all gritty or
rticles. Soak it in cold water for about twelve
Take it from the water, place it in a cullender,
n it. Being drained, place it in a saucepan or
with a pint and a half of sweet milk. Let it
half an hour, and keep stirring it all the time,
nt it from burning. During the boiling, sweeten
gar, and flavour it with cinnamon, or any other
a please. At the end of the half-hour's boiling,
s will be almost entirely dissolved, leaving
but a few thready fibres. You now strain it
a sieve, into a shape or mould. When cold, it
t out easily, and have all the appearance of a
mange. This forms one of the cheapest bla-
that can be served to table; it is also agreeable
ulate, and very nutritious. In cases of a hurry
g, six hours' soaking of the moss will do, but
es a waste.

berry Fool.—This is the simplest way of pre-

Set the pan on the fire again, and boil for three minutes or more, if the egg be quite fresh, or two minutes and a half, if the egg has been kept any time.

To Poach Eggs.- Take a shallow saucepan or frying-pan, and fill it about half full of water. Let the water be perfectly clean, not a particle of dust or dirt upon it. Put some salt into the water. Break each egg into a separate tea-cup, and slip it gently from the cup into the water. There is a knack in doing this, without causing the egg to spread or become ragged. A good way consists in allowing a little water to enter the cup and get below the egg, which sets the egg to a certain extent, before it is allowed to lie freely in the water. If the water be about boiling point, one minute is sufficient to dress the egg; but the eye is the best guide: the yolk must retain its liquid state, lying in the centre of the white. Have buttered toasted bread prepared on a dish, and cut in pieces rather larger than the egg; then take up the eggs carefully with a small slice, pare off any ragged parts from the edges, and lay them on the bread. They may be laid on slices of fried bacon, when preferred.

Buttered Eggs.—Put a piece of butter in a saucepan, and melt it, adding a little milk. Break the eggs into a basin, and pour them into the saucepan. Season with salt and pepper, and continue stirring the eggs till they are sufficiently dressed. Serve on pieces of toasted bread.

Omelettes.—Omelettes are composed of eggs and any thing that the fancy may direct to flavour and enrich them. For a common omelette, take six eggs, and beat them well with a fork in a basin; add a little salt. Next, take a little finely chopped parsley, finely chopped eschalot or onion, and two ounces of butter cut into small pieces, and mix all this with the egg. Set a frying-pan on the fire with a piece of butter in it; as soon as the butter is melted, pour in the omelette, and continue to stir it till it assume the appearance of a firm cake. When dressed on one side, turn it carefully, and dress it on the other. It will be dressed sufficiently when it is lightly browned. Serve it on a dish. The flavour may be varied, by leaving out the parsley and onion, and putting in finely chopped tongue or ham, oysters,

that sleepeth in harvest is a son that causeth shame.
He that walketh uprightly walketh surely; but he that perverteth his ways shall be known.
He that is surety for a stranger, shall smart for it; and he that hateth suretyship is sure.
He that keepeth [silent] his mouth, keepeth his life; but he that openeth wide his lips shall have destruction.
He that troubleth his own house shall inherit the wind; and the fool shall be servant of the wise of heart.
Heaviness in the heart of a man maketh it stoop; but a good word maketh it glad.
Hell and destruction are never full; so the eyes of man are never satisfied.
His own iniquities shall take the wicked himself, and he shall be holden with the cords of his own sins.
Hope deferred maketh the heart sick.

If sinners entice thee, consent thou not.
If the iron be blunt, and he do not whet the edge, then must he put to more strength; but wisdom is profitable to direct.*
If thine enemy be hungry, give him bread to eat; and if he be thirsty, give him water to drink: for thou shalt heap coals of fire upon his head, and the Lord shall reward thee.
If thou faint in the day of adversity, thy strength is small.
If ye cast pearls before swine, they will turn again and rend ye.
In all labour there is profit; but the talk of the lips tendeth only to penury.
Iron sharpeneth iron; so a man sharpeneth the countenance of his friend.
It is nought, it is nought, saith the buyer; but when he is gone his way, then he boasteth.
It is better to dwell in a corner of the house-top, than with a brawling woman in a wide house.

Let another man praise thee, and not thine own mouth; a stranger, and not thine own lips.
Love not sleep, lest thou come to poverty: open thine eyes, and thou shalt be satisfied with bread.

Much food is in the tillage of the poor: but there is that is destroyed for want of judgment.

Of making many books there is no end; and much study is a weariness of the flesh.

Pride goeth before destruction, and an haughty spirit before a fall.

Remove not the old landmark; and enter not into the fields of the fatherless.
Reprove not a scorner lest he hate thee; rebuke a wise man and he will love thee.
Righteousness exalteth a nation; but sin is a reproach to any people.

Say not unto thy neighbour, Go, and come again, and to-morrow I will give, when thou hast it by thee.
Seest thou a man diligent in his business: he shall stand before kings; he shall not stand before mean men.†
Seest thou a man that is hasty in his words: there is more hope of a fool than of him.
Strive not with a man without cause, if he have done thee no harm.

The blessing of the Lord, it maketh rich, and he addeth no sorrow with it.

Every thing hath an end, and a pudding hath two.
Every thing is good in its season.
Every thing is the worse for wearing.
Example teaches more than precept.
Experience is the mother of science.
Experience teaches fools.
Evil communications corrupt good manners.
Evil gotten evil spent.

Faint heart never won fair lady.
Fair and softly go far in a day.
Fair words make fools fain.
Fall not out with a friend for a trifle.
False friends are worse than open enemies.
Fancy may bolt bran and think it flour.
Far-fetched and dear-bought is good for ladies.
Fat paunches make lean pates.
Fat sorrow is better than lean sorrow.
Few take care to live well, but many to live long.
Fiddler's fare—meat, drink, and money.
Fine feathers make fine birds.
Fine words butter no parsnips.
Fire and water are good servants, but bad masters.
Fire is not to be quenched with tow.
First deserve and then desire.
Fly pleasure, and it will follow thee.
Fools make feasts, and wise men eat them.
Fools should never see half-done work.
Fools tie knots, and wise men loose them.
Fools will be meddling.
Forbearance is no acquittance.
Forgive and forget.
Forgive any sooner than thyself.
Fortune favours the brave.
Fortune has no power over discretion.
Fortune knocks once at least at every man's gate.
For want of company, welcome trumpery.
From fame to infamy is a beaten road.

Gather thistles, expect prickles.
Gentry sent to market will not buy one bushel of corn.
Get thy spindle and distaff ready, and God will send flax.
Give a dog an ill name and hang him.
Give a rogue rope enough, and he will hang himself.
Give it plenty of elbow grease [hard rubbing].
Give the devil his due.
God help the rich, the poor can beg.
God helps those who help themselves.
God send you more wit, and me more money.
God tempers the wind to the shorn lamb.
Go farther and fare worse.
Good counsel is above all price.
Good harvests make men prodigal, bad ones prudent.
Good to be merry at meat.
Good ware makes quick markets.
Good wine needs no bush.
Good words cost nothing, but are worth much.
Goods are not theirs who enjoy them.
Gossiping and lying go hand in hand.

* In most cases this would be a bad advice.

Jesting lies bring serious sorrows.
Judge not of a ship as she lies on the stocks.
Judge not of men or things at first sight.

Keep a thing seven years, and you will find a use for it.
Keep counsel thyself first.
Keep good men company, and you shall be of the number.
Keep no more cats than will catch mice.
Keep the bowels open, the head cool, and the feet warm, and a fig for physicians.
Keep thy shop, and thy shop will keep thee.
Keep your tongue within your teeth.
Kill two birds with one stone.
Kindness is lost upon an ungrateful man.
Kindnesses, like grain, increase by sowing.
Kissing goes by favour.
Knavery may serve a turn, but honesty is best in the end.

Land was never lost for want of an heir.
Lazy folks take the most pains.
Least said is soonest mended.
Lend thy horse, and thou mayest have back his skin.
Let every pedlar carry his own burden.
Let every tub stand on its own bottom.
Let not your tongue cut your throat.
Let sleeping dogs lie.
Let the cobbler stick to his last.
Let them laugh that win.
Life is half spent before we know what it is.
Life without a friend is death without a witness.
Light come, light go.
Lips however rosy must be fed.
Little and often fills the purse.
Little boats must keep near shore.
Little pitchers have great ears.
Little sticks kindle the fire, but great ones put it out.
Live and let live.
Live not to eat, but eat to live.
Lowly set, richly worn.
Lock the stable door when the steed is stolen.
Long looked-for comes at last.
Look before you leap.
Look to the main chance.
Look twice ere you determine once.
Lookers-on see more than players.
Losers are always in the wrong.
Love asks faith, and faith asks firmness.
Love me, love my dog.
Lovers live by love as larks by leeks. [Ironical.]
Lucky men need little counsel.

Make a virtue of necessity.
Make hay while the sun shines.
Make not your sail too large for your ship.
Make the best of a bad bargain.
Making a toil of a pleasure.
Man doth what he can, and God what he will.
Man proposes, God disposes.
Manners often make fortunes.
Many a slip betwixt the cup and the lip.
Many a true word is spoken in jest.
Many can pack the cards that cannot play.
Many go out for wool and come home shorn.
Many hands make light work.
Many words will not fill the bushel.
Marry in haste, repent at leisure.
Marry your sons when you will, your daughters when you can.
Mills and wives are ever wanting.
Mischiefs come by the pound, and go away by the ounce.
Misfortunes seldom come alone.
Misreckoning is no payment.
Modesty is the handmaid of virtue.
Money makes the mare to go.
Money will do more than my lord's letter.
More afraid than hurt.
Much is expected where much is given.
Much water goes by the mill the miller knows n
Much would have more and lost all.

's Drink-weel's brither.
n' cleaning only require a beginning.
n' drinking yuts awa the stamach.

Ell and tell is gude merchandise.
Envy is the rack of the soul and torture of the body.
Envy ne'er does a gude turn but when it means an ill ane.
Even as you won it say may you wear't.
Ever busy ever bare.
Every ane loups the dike where it's laighest.
Every ane to his trade, quoth the browster to the bishop.
Every bird thinks its ain nest best.
Every cock craws crousest on his ain midden head.
Every day's no Yule-day—cast the cat a castock.
Every fault has its fore.
Every flow has its ebb.
Every inch of joy has an ell of annoy.
Every man bows to the bush he gets bield frae.
Every man buckles his belt his ain gate.
Every man can guide an ill wife weel but him that has her.
Every man can tout best on his ain horn.
Every man has his ain draff pock.
Every man's tale's gude till anither's be tauld.
Every May be hath a May not be.
Every miller wad weise the water to his ain mill.
Every play maun be played, an' some maun be the players.

Fair words break nae banes, foul words mony.
Fancy flees before the wind.
Far-awa fowls hae fair feathers.
Farther east the shorter west.
Fause folk should hae mony witnesses.
Fausehood makes ne'er a fair hinder-end.
Favour unused is favour abused.
Fill fu' an' haud fu', that makes a man stark.
Flaes an' a girning wife are waukrife bed-fellows.
Flee ne'er so fast, your fortune will be at your tail.
Fleeing a bird is no the way to grip it.
Fling-at-the-goad was ne'er a gude ox.
Flitting o' farms mak mailens dear.
Fools are aye fond o' flittin'.
Fools are aye seeing ferlies.
Fool's haste is nae speed.
Fools laugh at their ain sport.
Fools set far trysts.
Fools shouldna hae chappin'-sticks.
For fashion's sake, as dogs gang to the market.
For want o' a steek a shoe may be tint.
Forbid a fool a thing, an' that he will do.
Frae saving comes having.
Fresh fish an' poor friends grow soon ill-faured.
Friends are like fiddle-strings, they maunna be screwed ower tight.
Friends gree best at a distance.
Friendship canna stand aye on ae side.
Fry stanes wi' butter, an' the broe will be gude.

Gathering gear is a pleasant pain.
Gaily wad be better.
Gear is easier gotten than guided.
Gentle partans hae lang taes.
Gentle servants are poor men's tinsel.
Get weel, keep weel.
Gie a bairn its will an' a whelp its fill, and neither will do weel.
Gie your tongue mair holidays than your head.
Giff-gaff maks gude friends.
Glasses an' lasses are brittle ware.
Glowering's nae gainsaying.
God ne'er sent the mouth, but he sent the meat wi't.
God send water to that well that folk think will ne'er rin dry.
God shapes the back for the burden.
Good wine makes a bad head and a lang story.
Gratitude is a heavy burden.
Great comfort is like ready gold in need.
Greedy folks hae lang arms.
Griening wives are aye greedy.
Guessed wark's best if weel done.

Gude advice is ne'er out o' season.
Gude ale needs nae wisp.
Gude bairns are eith to lear.
Gude breeding and siller mak our sons gentles.
Gude claes open a' doors.
Gude company on a journey is worth a coach.
Gude gear's not to be gapped.
Gude fishing in drumly water.
Gude folk are scarce, tak care o' ane.
Gude forecast farthers the wark.
Gude health is better than wealth.
Gude kail is half meat.
Gude watch prevents harm.
Gude will ne'er wants time to show itsel.
Gude will should be ta'en in part payment.
Gudely cow, gawsy calf.

Hae, gars a deaf man hear.
Hand-in-use is father o' lear.
Hang a thief when he's young, an' he'll no steal when he's auld.
Hang hunger an' drown drouth.
Hankering an' hinging-on is a poor trade.
Happy the wife that's married to a mothering man.
He can hide his meat and seek mair.
He can say Jo, and think it no.
He can see an inch before his nose.
He cares na wha's bairns greet if his laugh.
He comes oftener wi' the rake than the shool.
He complains early that complains o' his tail.
He doesna ken what end o' him's uppermost.
He doesna aye ride when he saddles.
He doesna like his wark that says *now* when it.
He eats the calf i' the cow's wame.
He gangs awa in an ill time that ne'er comes again.
He gangs lang barefoot that wears dead man's shoon.
He girns like a sheep-head in a pair o' tangs.
He has a caup for a' corn.
He has a gude judgment that doesna lippen ain.
He has a hearty hand for gieing a hungry meal.
He has a slid grip that has an eel by the tail.
He has been rowed in his mither's sark tail.
He has brought his pock to a braw market.
He has come to gude by misguiding.
He has coosten his cloak on his ither shoulder.
He has coupit the meikle pot into the little.
He has faut o' a wife that marries mam's pet.
He has feathered his nest, he may flee when he likes.
He has gotten the whip hand of him.
He has lain on his wrang side.
He has licked the butter aff my bread.
He has mair wit in his little finger than ye have in your bouk.
He has muckle prayer but little devotion.
He has some wit, but a fool has the grinding o't.
He has the best end of the string.
He has wit at will that wi' an angry heart still.
He has't o', kind, he coft it not.
He hears wi' his heel, as geese do in harvest.
He kens his ain groats amang ither folk's kail.
He kens whilk side his cake is buttered on.
He'll gie you the whistle o' your groat.
He'll have eneugh some day, when his mouth's mools.
He'll mak an ill runner that canna gang.
He'll mend when he grows better, like sour summer.
He'll neither dance nor haud the candle.
He'll no gie an inch o' his will for a span o' his life.
He'll no let grass grow at his heels.
He'll no sell his hen on a rainy day.
He'll soon be a beggar that canna say no.
He'll tell it to nae mair than he meets.
He lo'ed mutton weel that licked where the ewe.
He lo'es me for little that hates me for nought.
He looks like the far end of a French fiddle.
He maun be soon up that cheats the tod.

› leave to speak that canna haud his

fault that canna mend.
ng spoon that sups wi' the deil.
a gude darg that gaed grumbling about it.
sin in his punishment.
er that never fa's.
at forgets himsel.
at marries at Yule; for when the bairn's
› corn's to shear.
of a right nest.
f a wise mind, that of a foe can mak a

cook that maunna lick his ain fingers.
fox that winna scrape his ain hole.
niel that can neither do nor say.
ess guidman that's no miss'd.
me as water in a riven ship.
af on that side o' the head.
close that has riven breeks.
dogs do when wives sift meal.
ie in a blanket.
singet cat, better than he's likely.
est wright that casts maist spails.
aft as he lets on.
›n up that's hanged e'er noon.
ugh that's ill lo'ed.

He wad gar you trow that the moon's made o' green cheese.
He wad tine his lugs if they were not tacked to him.
He was mair fleyed than hurt.
He was scant o' news that tauld his father was hanged.
He was the bee that made the honey.
He winna send you awa' wi' a sair heart.
Highlanders—shoulder to shoulder.

I canna sell the cow an' sup the milk.
I hae mair to do than a dish to wash.
I ken by my cog my cow's milked.
If ae sheep loup the dyke, a' the rest will follow.
If the deil be laird, ye'll be tenant.
If the deil find you idle, he'll set you to wark.
If the lift fa', the laverocks will be smoored.
If you win at that, you'll lose at naething.
If ye sell your purse to your wife, gie her your breeks to the bargain.
Ill bairns are aye best heard at hame.
Ill bairns aye get broken brows.
Ill beef ne'er made gude broe.
Ill comes upon waur's back.
Ill counsel will gar a man stick his ain mare.
Ill doers are aye ill dreaders.
Ill getting het water frae 'neath cauld ice.
Ill hearing maks wrang rehearsing.
Ill herds mak fat foxes.
Ill laying up maks mony thieves.
Ill payers are aye gude cravers.
Ill will ne'er spak weel.
Ill-won gear winna enrich the third heir.
Ill workers are aye gude onlookers.
I'll ne'er brew drink to treat drunkards.
I'll ne'er keep a cow when I can get milk sae cheap.
I'll ne'er keep a dog and bark mysel.
I'll ne'er lout sae laigh and lift sae little.
I'll ne'er put the rogue aboon the gentleman.
I'll rather strive wi' the lang rigg than the ill neighbour.
I'll serve ye when ye hae least to do.
I'll tak the best first, as the priest did o' the plums.
I might bring a better speaker frae hame than you.
I'm no every man's dog that whistles on me.
I'm no obliged to summer an' winter it wi' you.
I'm no sae blind as I'm bleer-eyed.
I'm no sae scant o' clean pipes as to blaw wi' a brunt cutty.
I'm o'er auld a cat to draw a strae before.
I'm speaking o' hay and you o' horse corn.
I ne'er sat on your coat-tail.
I think mair o' your kindness than its a' worth.
It maun be true what a' folk says.
It's a far cry to Lochaw.
It's a hard task to be poor and leal.
It's a mean mouse that has but ae hole.
It's a nasty bird that files its ain nest.
It's a silly hen that canna scrape for ae bird.
It's an ill pack that's no worth the custom.
It's better to sup wi' a cutty than want a spoon.
It's by the head that the cow gies milk.
It's far to seek an' ill to find.
It's gude baking beside the meal.
It's gude sleeping in a hale skin.
It's gude to be sib to siller.
It's gude gear that pleases the merchant.
It's gude to be in your time, ye kenna how lang it may last.
It's gude to dread the warst, the best will be the welcomer.
It's hard both to have and want.
It's hard for a greedy e'e to hae a leal heart.
It's hard to sit in Rome an' strive wi' the pope.
It's ill bringing butt what's no ben.
It's ill speaking between a fu' man and a fasting.
It's ill wared that wasters want.
It's kittle for the cheeks when the hurlbarrow gaes o'er the brig o' the nose.

It's kittle shooting at corbies and clergy.
It's kittle to waken sleeping dogs.
It's lang before the deil be found dead at the dyke-side.
It's lang ere the deil dee.
It's nae laughing to girn in a widdy.
It's nae play when ane laughs and anither greets.
It's needless to pour water on a drowned mouse.
It's no lost what a friend gets.
It's not what is she but what has she.
Its ower far between the kitchen an' the ha'.
It's ower late to spare when the back's bare.
It's past jouking when the head's aff.
It's stinking praise comes out o' ane's ain mouth.
It's the best spoke in your wheel.
It's well that our faults are not written in our face.
It was never for naething that the gleg whistled.
It will be feathered out o' your wing.
It will be lang ere ye wear to the knee lids.
I wad be scant o' claith to sole my hose wi' dockens.
I would rather see't than hear tell o't.
I wadna be deaved wi' ye're keckling for a' your eggs.
I wadna ca' the king my cousin.
I wish you readier meat than a rinnin hare.

Joke at leisure, you kenna wha may jibe yoursel.
Jouk and let the jaw gang by.

Keep out o' his company that cracks o' his cheatery.
Keep something for a sore foot.
Keep the feast till the feast day.
Keep the staff in your ain hand.
Keep your ain fish guts to your ain sea-maws.
Keep your breath to cool your own porridge.
Keep your mouth shut and your e'en open.
Ken when to spend and when to spare, and ye needna be busy, and ye'll ne'er be bare.
Ken yoursel, and your neighbour winna misken you.
Kend folk's nae company.
Kings and bears aft worry their keepers.
Kings' chaff's worth other folk's corn.
Kings' cheese gaes half away in parings.
Kings hae lang hands.
Kindle a candle at baith ends, it will soon be done.
Kindness comes o' will, it canna be coft.
Kindness will creep where it canna gang.
Kiss a carle and clap a carle, that's the way to tine a carle.
Kythe in your ain colours, that folk may ken you.

Laith to bed and laith to rise.
Lang fasting gathers wind.
Lang fasting hains nae meat.
Lang standing and little offering maks a poor priest.
Lang straes are nae motes.
Laugh at leisure, ye may greet ere night.
Law's costly, tak a pint and gree.
Law makers shouldna be law breakers.
Lay the head o' the sow to the tail o' the grice.
Lay your wame to your winning.
Leal heart never lied.
Learn the cat the road to the kirn, and she'll aye be lickin.
Learn you to an ill habit, and ye'll ca't custom.
Learn young, learn fair.
Let a' trades live, quoth the wife, when she brunt her besom.
Let alane, maks mony a loon.
Let byganes be byganes.
Let him cool in the skin he het in.
Let him tak a spring on his ain fiddle.
Let his ain wand ding him.
Let ilka ane soop before their ain door.
Let ilka sheep hang by its ain shank.
Let na the plough stand to kill a mouse.
Let the horns gang wi' the hide.
Let the mickle horse get the mickle windlin.
Let the tow gang wi' the bucket.
Let them care that come behind.
Let your meat dit your mouth.
Light burdens break nae banes.
Like a cow on an unco loan.
Like a sow playing on a trump.
Like butter in the black dog's hause.
Like hens, ye rin aye to the heap.
Like the bairns o' Falkirk, ye mind naething [illegible] chief.
Like the cat, fain fish wad ye eat, but ye are [illegible] weet your feet.
Like the wife that aye took what she had, [illegible] wanted.
Like the wife that ne'er cries for the ladle till [illegible] rins o'er.
Like the wife wi' the mony daughters, the last [illegible] hindmost.
Like's an ill mark.
Lippen to me, but look to yoursel.
List to meat's gude kitchen.*
Little dogs hae lang tails.
Little folk are soon angry.
Little Jock gets the little dish, and that hauds [illegible] little.
Little kenned, the less cared for.
Little meddling maks fair parting.
Little wats the ill-willy wife what a dinner may
Little wit in the head maks mickle travel to the
Little mense to the cheeks to bite aff the nose.
Living at heck and manger.
Lock your door, that you may keep your neighbour honest.
Lo'e me little, an' lo'e me lang.
Love and lairdships like nae marrows [equals]
Love is as warm among cottars as courtiers.
Love owerlooks mony faults.

Maidens should be mild and meek, quick to hear, slow to speak.
Mair by luck than gude guiding.
Mair haste the waur speed, quoth the tailor lang thread.
Mair than eneugh is ower mickle.
Mak a kirk an' a mill o't.
Mak nae toom ruse.
Malice is aye mindfu'.
Marriage and hanging go by destiny.
Marry a beggar, and get a louse for your tocher.
Marry aboon your match, and get a master.
Marry for love, and work for siller.
Master's will is gude wark.
Mastery maws the meadows down.
Maun-do is a fell fallow.
May-be's are no aye honey-bees.
Measure twice, cut but ance.
Meat feeds, claith cleads, but manners mak the man.
Mickle musing mars the memory.
Mickle power maks mony foes.
Mickle about ane, quoth the deil to the collier.
Mickle gifts mak beggars bauld.
Mickle head, little wit.
Mickle maun a gude heart thole.
Mickle meat, mony maladies.
Mess and meat ne'er hinder'd wark.
Mettle's dangerous in a blind mare.
Money is like the muck midden, it does nae gude be spread.
Money is welcome any way.
Money maks a man free ilka where.
Mony an honest man needs help that hasna the sense to seek it.
Mony ane kisses the bairn for love o' the nurse.
Mony ane lacks what they would fain hae in pack.
Mony ane serves a thankless master.
Mony ane speers the gate they ken fu' weel.
Mony ane's gear is mony ane's death.
Mony gude-nights is laith away.

* Hunger is the best sauce.

† Death never gave him scathe.

The book o' maybes is very braid.
The cost owergangs the profit.
The deil aye drives his hogs to an ill market.
The deil doesna aye show his cloven cloots.
The deil gaes awa when he finds the door steekit against him.
The deil's bairns have aye their daddy's luck.
The deil's aye gude to his ain.
The deil's gane ower Jock Wabster.*
The deil will tak little ere he want a'.
The deil's aye busy wi' his ain.
The first fut o' a fat haggis is the bauldest.
The foot at the cradle and the hand at the reel, is a sign that a woman means to do weel.
The grace o' a grey bannock's in the baking o't.
The head for the washing.
The higher the hill the laigher the grass.
The hurt man writes wi' steel on marble stane.
The king may come in the cadger's gate.
The kirk's mickle, but you may say mass in the end o't.
The laird may be laird, and yet need his hind's help.
The master's foot's the best measure.
The o'ercome only fashes folk to keep.
There is an act in the Laird o' Grant's court, that no aboon eleven speak at ance.
There was a wife that kept her supper for her breakfast, and she was dead ere day.
There was ne'er a gude town but there was a dub at the end o't.
There was never a silly Jocky but there was as silly a Jenny.
There was ne'er a thrifty wife wi' a sheet about her head.
There's a dub before every door.
There's a tough sinew in an auld wife's heel.
There's a whaup i' the raip.†
There's aye some water where the stirkie drowns.
There's beild aneath an auld man's beard.
There's steel in the needle point, though little o't.
There's the end o' an auld sang.
The simple man's the beggar's brither.
The smith's mare and the souter's wife are aye the warst shod.
The tod ne'er sped better than when he gaed his ain errand.
The thing that lies na in your gate breaks na your shins.
The thrift o' you and the woo o' a dog wad mak a braw web.
The worth o' a thing is best kenned by the want o't.
The wife's aye welcome that comes wi' a crooked oxter.‡
They'll gree better when they gang in by different kirk doors.
They that board wi' cats maun count upon scarts.
They that burn you for a witch lose a' their coals.
They that gie you hinder you to buy.
They that lie down for love should rise up for hunger.
They that love maist speak least.
They were scant o' bairns that brought you up.
They are sad rents that come in wi' tears.
They hae need o' a canny cook that hae but ae egg to their dinner.
They may ken by your beard what has been on your board.
They ne'er saw great dainties that think a haggis a feast.
They should kiss the guidwife that wad win the guidman.
They speak o' my drinking, but ne'er think o' my drouth.
They that get a word o' soon rising may lie a' day.
They that see you a' day winna break the house for you at night.
Three can keep a secret when twa are away.

SAYINGS.

mdi (A. M.) In the year of the world.
ori. From the effect to the cause.
From the cause to the effect.
legantiarum. Master of the ceremonies.
tum ad hominem. An argument to the man.
elare artem. The perfection of art is to conceal.
ram partem. Hear the other party.
ulta, sed loquere pauca. Hear much, but say

ra fames. The accursed appetite for gold.
ar aut nullus. He will either be Cæsar or
.
tutis constantia. Constancy is the foundation
ue.
le qui procul negotiis. Blessed are they who
from toil.
. In good faith; in reality.
fulmen. A harmless thunderbolt.
s. An evil custom. Thus, cacoethes loquendi—
di. A rage for talking—scribbling.
elli. The cause or reason for war.
rtuum. The worthless remains.
. Submit to God.
quis. Give way to the powerful.
rma togæ. Let arms yield to eloquence.
ete finem. Aim at a sure end.
ia proprie dicere. To express common things
ropriety.
negotiis. In a state of sane mind.
s res parvæ crescunt. Small things increase
on.
ecte agens. Fear not while acting justly.
nos mores. Against good morals.
elicti. The body of the crime.
udæus apella. Let the circumcised Jew be
at.
! To what good!
calamo. With a running pen.
hings given or granted.
—de jure. From the fact—from the law.
lo pariterque momento. By imparting at once
n and instruction.
est Carthago. Carthage must be destroyed.
erds of Cato.)
is nil nisi bonum. Let nothing be said of the
ut what is favourable.
nte—juvante—volente. With God's favour—
will.
lum. A thing desired.
in loco. To play the fool at the right time.
eters. The remainder is wanting.
le, regem serva. Worship God, serve the

tector noster. God is our protector.
icos. Love your friends.
impera. Divide and govern.
decorum est pro patria mori. It is sweet and
s to die for one's country.
mus vivamus. Let us live while we live.
s in rebus. There is a medium in all things.
etua. Be thou perpetual.
i videris. Be what you seem to be.
ira. From the chair; authoritatively.
gratia (E. g. and Ex. gr.) By way of ex-

nihil fit. Nothing produces nothing.
. By virtue of his office.
On one part.
Herculem. Judge of the size of the statue of
s by the foot.
rede. Believe an experienced man.
re. Without premeditation.
n. Do the like: an engraved resemblance of
iting.
per viret. A good name will shine for ever.
firmat pietas. Devotion strengthens families.
ab hoste doceri. It is allowable to derive
tion even from an enemy.

Felo de se. A suicide.
Fiat justitia, ruat cœlum. Let justice be done, though the heavens should fall.
Fortuna favet fortibus. Fortune favours the bold.
Fruges consumere nati. Men born only to consume food.
Haud passibus æquis. With unequal steps.
Hinc illæ lachrymæ. Hence proceed these tears.
Id est (i. e.) That is.
Id genus omne. All persons of that description.
Imprimatur. Let it be printed.
Impromptu. Without study.
In forma pauperis. In the form of a poor man.
In propria persona. In person.
In re. In the matter of.
In terrorem. In terror.
In transitu. In passing.
Ipse dixit. He himself said it: dogmatism.
Judex damnatur cum nocens absolvitur. Guilt attaches to a judge when the guilty are suffered to escape.
Jure divino—humano. By divine—by human law.
Labor omnia vincit. Labour conquers every thing.
Lapsus linguæ. A slip of the tongue.
Lex talionis. The law of retaliation.
Locum tenens. A deputy or substitute.
Magna est veritas, et prævalebit. The truth is powerful, and will ultimately prevail.
Materiem superabat opus. The workmanship surpassed the materials.
Medio tutissimus ibis. A medium course will be the safest.
Memento mori. Remember death.
Mens sibi conscia recti. A mind conscious of rectitude.
Mirabile dictu. Wonderful to tell.
Multum in parvo. Much in little.
Mutatis mutandis. After making the necessary changes.
Necessitas non habet leges. Necessity has no law.
Nem. con. An abbreviation of *nemine contradicente*. Without dissent or opposition.
Ne plus ultra. Nothing beyond—the utmost point.
Ne quid nimis. Too much of one thing is good for nothing.
Ne sutor ultra crepidam. Let not the shoemaker go beyond his last.
Nisi Dominus frustra. Unless the Lord assist you, all your efforts are in vain.
Noscitur ex sociis. He is known by his companions.
Nota Bene (N. B.) Mark well.
Obiter dictum. A thing said by the way, or in passing.
Onus probandi. The weight of proof; the burden of proving.
O si sic omnia! Oh that he had always done, or spoken thus!
O tempora, O mores! Oh the times, oh the manners!
Otium cum dignitate. Ease with dignity.
Palmam qui meruit ferat. Let him who has won bear the palm.
Pari passu. By a similar gradation.
Par nobile fratrum. A noble pair of brothers.
Particeps criminis. An accomplice.
Passim. Every where.
Per fas et nefas. Through right and wrong.
Per se. By itself.
Poeta nascitur non fit. Nature, not study, m a poet.
Prima facie. On the first view, or appearanc
Primæ viæ. The first passages: the upper pa intestinal canal.
Primum mobile. The main spring; the first
Principiis obsta. Oppose the first appearance
Pro aris et focis. For our altars and firesides.
Pro bono publico. For the public good.
Pro et con. For and against.
Pro re nata. For a special business.
Pro tempore. For the time.
Quid nunc? What now?—Applied to a news
Quid pro quo. What for what; tit for tat.
Quoad hoc. To this extent.
Quod erat demonstrandum. Which was mea shown.
Rara avis in terris, nigroque simillima cygno. bird in the earth—very like a black swan.
Reductio ad absurdum. A reducing to an abs
Re infecta. Without attaining his end.
Requiescat in pace. May he rest in peace.
Res angusta domi. Narrow circumstances at
Respice finem. Look to the end.
Seriatim. In order.
Sic itur ad astra. Such is the way to immorta
Sic passim. So every where.
Sic transit gloria mundi. Thus the glory of th passes away.
Sine die. To an indefinite time.
Sine qua non. An indispensable condition.
Status quo ante bellum. The state in which be ties were before the war.
Suaviter in modo, fortiter in re. Gentle in the m but vigorous in the deed.
Sub silentio. In silence.
Summum bonum. The chief good.
Suum cuique. Let every man have his own.
Tabula rasa. A smoothed tablet.
Tempora mutantur, et nos mutamur in illis. Th change, and we change with them.
Toties quoties. As often as.
Ubi supra. Where above mentioned.
Vade mecum. Go with me: a constant compa (Usually applied to a pocket-book).
Veluti in speculum. As if in a mirror.
Veni, vidi, vici. I came, I saw, I conquered.
Vis inertiæ. Force or property of inanimate ma
Versus (v.) Against.
Vice versa. The terms or cases being changed.
Vi et armis. By main force.
Viva voce. By or with the living or loud voic
Viz. (videlicet.) Namely.
Vox et præterea nihil. A voice and nothing m
Vox populi, vox Dei. The voice of the people voice of God.

END OF THE FIRST VOLUME.
